

INSTALLATION AND SERVICE MANUAL

WARNING: Please read completely before you install or operate your new pump! This is an external "out-of-pond" pump! It is NOT submersible! Do NOT allow this pump to become submerged! Never run dry! Max. case pressure. - 65 PSI!

Economy With Efficiency.

We congratulate you on your choice of the Valuflo[™] 1000 Centrifugal Pump! It has been carefully designed using the advantages of today's technology and carefully constructed to give you the dependability of yesterday. To insure proper performance, we urge you to carefully follow the instructions in this manual. If you have any questions, call your nearest distributor or M.D.M. for assistance.

INSTALLATION

Please read carefully! When properly installed the Valuflo™ 1000 will provide dependable trouble-free service.

- 1. Locate the pump as near the water source as possible. A flooded suction situation is preferred. The pump is not self-priming, therefore, if the fluid level is below the pump, a swing check valve must be installed and the pump primed prior to start-up. (Figure 2)
- 2. Mount motor base to a secure, immobile foundation.
- 3. Use only plastic fittings on both the intake and discharge ports. Seal pipe connections with Teflon[™] paste. These fittings should be self-supported and in neutral alignment with each port. (i.e. Fittings must not be forced into alignment which may cause premature line failure or damage to the pump volute.) For non-flooded installations, a strainer basket and check valve are recommended.
- 4. Never restrict the intake. Keep both input and discharge lines as free of elbows and valves as possible. Always use pipe of adequate diameter. This will reduce friction losses and maximize output.
- 5. This pump is not self-priming! It must not be run dry! We recommend a flooded suction installation. Please read carefully! When properly installed, the pump will provide dependable, trouble-free service.
- 6. For additional plumbing tips, review MDM's website: www.mdminc.com for pond plumbing and pump installation hints.

WARNING: ALWAYS SHUT OFF ELECTRICAL POWER BEFORE INSTALLATION AND / OR SERVICING THIS PUMP! ALL ELECTRICAL WIRING SHOULD MEET STATE AND LOCAL ORDINANCES. IMPROPER WIRING MAY NOT ONLY BE A SAFETY HAZARD BUT MAY PERMANENTLY DAMAGE THE MOTOR AND/OR PUMP! 230V 50 HZ MOTORS AVAILABLE - CONTACT YOUR SUPPLIER FOR INFORMATION.

ELECTRICAL HOOK-UP

- 1. Check that supply voltages match the motor's requirements.
- 2. Check motor wiring and connect, according to instructions on motor, to match supply voltage.
- 3. Power cord should be protected by conduit or by cable and be of proper gauge. It should be no longer than necessary.
- 4. Power should be drawn directly from a box with circuit breaker protection or with a fused disconnect switch.

ValuFlo 1000

PUMP END ASSEMBLY

- 1. Clean and inspect all pump parts (0-ring, seal seats, motor shaft, etc.).
- 2. Apply sealant to the bracket bore ID wall and around the seal case follow sealant mfg. instructions. We recommend using Gasgacinch®. Silicone sealant can also be used.
- 3. Press carbon graphite seal into bracket while taking care not to damage carbon graphite face.
- 4. Place slinger (rubber washer) over motor shaft and mount bracket to motor.
- 5. Carefully, lubricate the seal seat elastomer OD and impeller hub ID with water. Press the seal seat into the impeller hub making certain that the ceramic is in evenly the sealing surface should be parallel with the impeller hub.
- 6. Carefully lubricate carbon-graphite and ceramic sealing surfaces with CLEAN water. Do not use silicon lubricants or grease!
- 7. Assemble Bracket to motor with four M-bolts
- 8. Thread impeller onto shaft and tighten! If required, remove motor end-cap and use a screwdriver on the back of motor shaft to prevent shaft rotation while tightening. Replace motor end cap.
- 9. Seat large O-ring in volute slot and assemble volute to bracket with seven 1/4-20 x 2 3/4" hex cap screws, washers and nuts. Tighten in a cross pattern (30 in-lbf).
- 10. Install drain plug with its O-ring in volute drain hole.
- 11. Before operating pump, allow a proper cure time for the sealant used in step 2.

DESCRIPTION	MDM P/N
DRAIN PLUG	1000.110 LG
O-RING, DRAIN PLUG	E014B70
VOLUTE	K000.070 LG
LARGE O-RING	1000.061
IMPELLER	1000.05*
SEAL - BRASS	1000.0415
SEAL - SS316	1000.0414
BRACKET	K000.030 LG
SLINGER	1000.010V
HARDWARE KIT	1000.502

Note: These part numbers are only for standard models within the Valuflo™ 1000 series. 1000.05__ * Consult Factory for Impeller

Motor illustration is for reference only.

DISASSEMBLY

- 1. Shut off power to motor before disconnecting any electrical wiring from the back of the motor.
- 2. Disassemble volute from bracket by removing the seven 1/4" 20 threads per inch x 2 3/4" hex cap screws.
- 3. Remove cap covering shaft at back of motor and with a large screwdriver, prevent shaft rotation while unscrewing impeller.
- 4. Remove ceramic piece from impeller. (If you are replacing the seal)
- 5. Detach bracket from motor.
- 6. Remove carbon-graphite seal from bracket by pressing out from the back. Do not dig out from the front! (If you are replacing the seal)

Economy With Efficiency.

MAINTENANCE

Lubrication

Motor - Permanently Lubricated ball bearings - no service required. Rotary Seal - Requires no lubrication after assembly.

WARNING: EYE PROTECTION IS STRONGLY RECOMMENDED

*The pump must be drained before servicing or if stored below freezing temperatures. Periodic replacement of seals may be required due to normal carbon wear.

Insufficient Prime Prime system with water and parge all air from suction piping. Insufficient Prime Verify power supply and connection from panel to pump. Excessive Noise Cavitation Increase pipe size where possible. Decrease suction pipe length, reduce the number of elbows, etc. Verify hydraulic compatibility: i.e. pump and pipe are sized for the system. Insufficient Power Verify power supply and connection from panel to pump. Verify proper voltage. Some models are dual voltage (115/230). Ensure valves are open. Flow Restriction Ensure plumbing is clear, including suction strainers, check valves, etc.	Excessive Noise	Cavitation	Verify airtight plumbing on the suction plumbing especially fittings!
Excessive Noise Decrease suction pipe length, reduce the number of elbows, etc. Verify hydraulic compatibility: i.e. pump and pipe are sized for the system. Insufficient Power Verify power supply and connection from panel to pump. Verify proper voltage. Some models are dual voltage (115/230). Ensure valves are open. Flow Restriction Ensure plumbing is clear, including suction strainers, check valves, etc.			
Excessive Noise Verify hydraulic compatibility: i.e. pump and pipe are sized for the system. Insufficient Power Verify power supply and connection from panel to pump. Verify proper voltage. Some models are dual voltage (115/230). Flow Restriction Ensure valves are open. Ensure plumbing is clear, including suction strainers, check valves, etc.			Increase pipe size where possible.
Excessive Noise Insufficient Power Verify power supply and connection from panel to pump. Verify proper voltage. Some models are dual voltage (115/230). Ensure valves are open. Flow Restriction Ensure plumbing is clear, including suction strainers, check valves, etc.			Decrease suction pipe length, reduce the number of elbows, etc.
Insufficient Power Verify power supply and connection from panel to pump. Verify proper voltage. Some models are dual voltage (115/230). Flow Restriction Ensure valves are open. Ensure plumbing is clear, including suction strainers, check valves, etc.			Verify hydraulic compatibility: i.e. pump and pipe are sized for the system.
Verify proper voltage. Some models are dual voltage (115/230). Ensure valves are open. Flow Restriction Ensure plumbing is clear, including suction strainers, check valves, etc.		Insufficient Power	Verify power supply and connection from panel to pump.
Ensure valves are open. Flow Restriction Ensure plumbing is clear, including suction strainers, check valves, etc.			Verify proper voltage. Some models are dual voltage (115/230).
		Flow Restriction	
Verify check valve orientation and direction of permitted flow			Ensure plumbing is clear, including suction strainers, check valves, etc.
verify encervative orientation and an eccion of perimitiea now.			Verify check valve orientation and direction of permitted flow.
