\*All amperes based on 3ph 60 cycle power.

## GENERAL

The Chromalox Horizontal Electric Vaporizer is a thoroughly engineered pre-tested package, designed to give years of service, virtually maintenance free if properly installed. The CHTV series is ASME certified for 150 PSI at 750°F and is available in four models, each with basic features that comply with the National Electrical Code. Model CHTV has general-purpose NEMA I construction and can be used where no hazards exist. Model CHTVO is oil and dust tight as specified by NEMA XII standards. Model CHTVW can be used where weather-resistant construction is required and is constructed according to NEMA IV specifications.

Model CHTVX, Class 1, Group D, Division 1 is explosion-resistant and is constructed to operate in hazardous or explosive areas. **WARNING:** Vessel and pipe surfaces could achieve temperatures higher than allowed for Class 1, Group D, Division 1 hazardous areas. Common to all four models: OCE (open coil element) type heating elements installed in 3", schedule 40 seamless carbon steel pipes; watt density on the outside of the pipe surface is 10 watts per square inch; elements are removable without draining the fluid in the vaporizer; requirements 208, 240, 480 and 550 volt, 3 phase, 60 cycle, 15 to 300kW.

## INSTALLATION

**CAUTION:** This vaporizer is not for use with water or ethylene glycol and water mixtures as the heat transfer media. Check with your local Chromalox Sales and Application Engineer to be sure that you are using an accepted heat transfer media in this vaporizer or consult PQ301.

**Note:** When installing the vaporizer, allow a minimum of 3 feet for removing heating element if, and when, necessary.

### HYDRAULIC OR MECHANICAL:

**Note:** The CHTVW vaporizer should be mounted so that the control box does not fall in direct sunlight.

The bed plate should be mounted on solid foundation, preferably level.

The pipe lines from the Chromalox vaporizer to the process should be the same size as the vaporizer's piping connections. All piping should be arranged so that the vaporizer is not subject to extreme nozzle loading due to thermal expansion and contraction of pipe lines. If these instructions are not followed, cracks could develop in the vaporizer where the inlet and outlet nozzles are attached.

1. The piping of the entire system should be arranged to minimize pockets where air may be trapped. Manual air vents or bleeder valves should be provided at all high points in the system and every time the flow of the condensate has to drop.

### 2. Condensate return systems:

**A. Gravity return type:** The simplest and most easily operated type of vaporizer is one in which the condensate from the heating equipment is returned to the vaporizer by gravity, thus providing a system without moving parts. Such a system is possible if there is sufficient difference in elevation between the process and the vaporizer so the static liquid head will counter-balance all frictional losses in the vaporizer, vapor piping process and condensate return piping without flooding the heated equipment. See Figure 1 for a typical schematic piping diagram.

**B. Pumped return type:** Where there is insufficient difference in elevation between the vaporizer and the process, the condensate must be returned to the vaporizer by a pump.

Normally, these pumps are of the centrifugal type; however, positive displacement pump may also be used. See Figure 2 for a typical schematic piping diagram.

3. **Hartford Loop** – In gravity return systems a Hartford Loop should be incorporated where the condensate is returned to any point below the desired liquid level of the vaporizer.

A Hartford Loop consists of a line without valves outside of the vaporizer connecting the vapor outlet and the condensate inlet. The condensate return line is connected to the vapor-condensate line or loop at the same elevation as the lowest permissible level in the vaporizer. Thus, a vacuum in the heated equipment can then pull liquid from the vaporizer (or a closed valve in the vapor line can force liquid from the vaporizer) only until the level in the vaporizer falls to the level of this connection. Also, the resultant liquid hammering will give warning that the liquid level in the vaporizer is too low. (See Figure 1 below.)

4. **Note:** All flange connections should be checked and tightened if necessary. These sometimes loosen during transit.

### ELECTRIC:

kW	Volts	Control Box Size			No. Circuits	Control Accomplished By
		H	L	D		
15 Thru 30	240 or 480	30	24	8	1	1 Pressure Control with 1 Switch
40 Thru 60	240 or 480	30	30	8	2	1 Pressure Control with 2 Switches
75 Thru 100	240 or 480	42	30	8	3	1 Pressure Control with 3 Switches
125 Thru 150	480	48	36	8	4	1 Proportional Pressure Control with 4-step electronic stepper
175 Thru 300	480	60	36	8	6	1 Proportional Pressure Control with 6-step electronic stepper

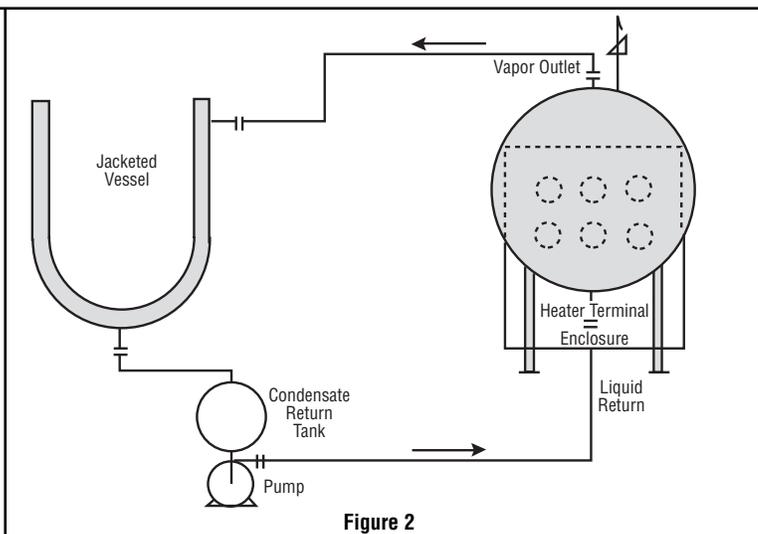

Figure 2

## INSTALLATION

**CAUTION: Hazard of Electric Shock. The vaporizer must be grounded using the grounding means provided in the heater terminal box and in the control box, and employ wiring in accordance with the National Electrical Code.**

1. The vaporizer is normally supplied one of three different ways:
  - A. Without controls as they are going to be provided by the customer. The customer will have to wire from his supplied controls to the level or float switch on the vessel, and to the heater terminal blocks and the ground lug in the heater terminal enclosure.
  - B. With controls supplied, but mounted remotely by the user. The customer will have to wire from remote controls to the level or float switch on the vessel, and to the heater terminal

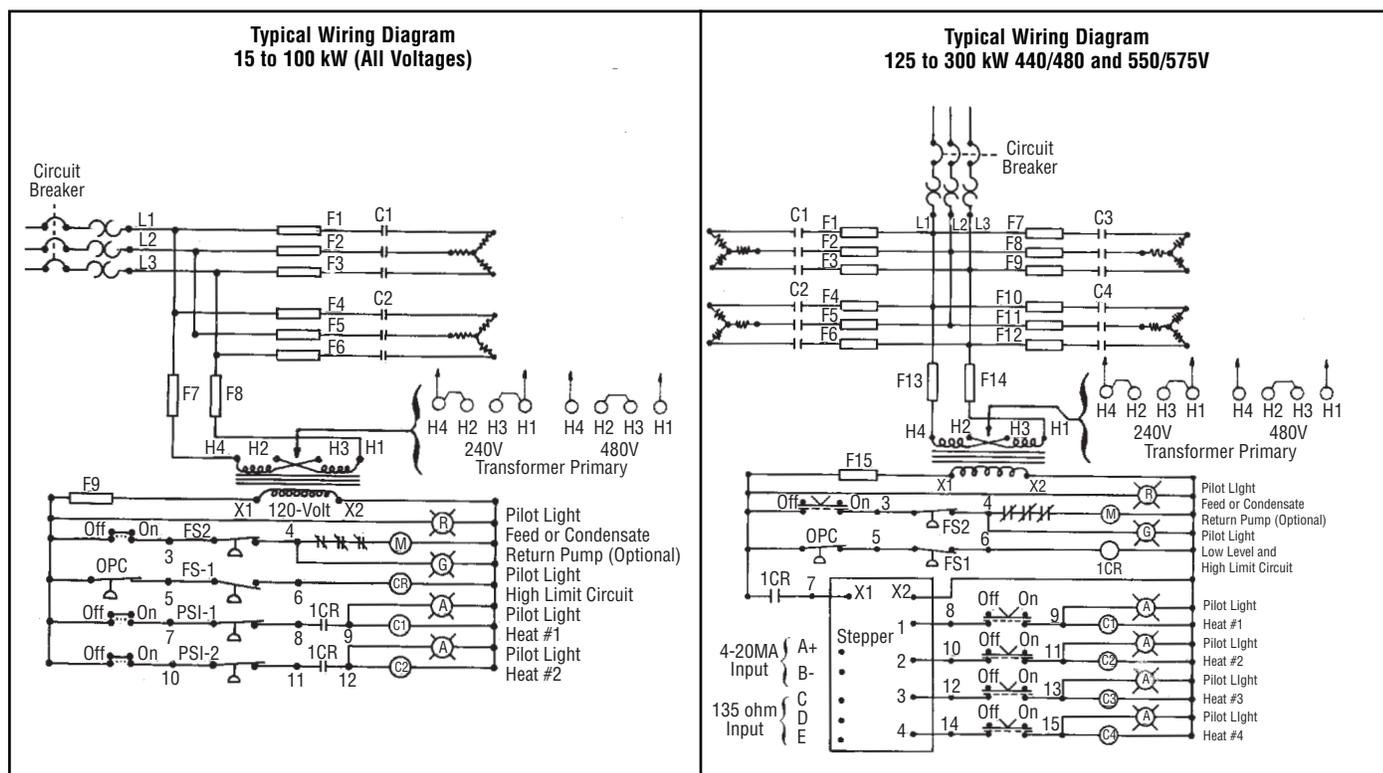

blocks and the ground lug in the heater terminal enclosure.

- C. With all controls mounted on the same skid with the hydraulic or mechanical part of the vaporizer. The unit is completely wired. The only wiring necessary is to terminals L1, L2 and L3 on the main circuit breaker and the grounding lug in the control panel.

2. **Note:** All electrical connections should be checked and tightened if necessary. These sometimes loosen in transit.

**CAUTION: Hazard of Electric Shock. Disconnect all power before servicing the vaporizer.**

## WIRING DIAGRAMS

## OPERATION

**CAUTION:** To avoid possible damage to the heaters, do not energize the heaters until the vaporizer is filled with fluid.

1. The filling of the Chromalox CHTV type horizontal vaporizer is accomplished in one of two ways:
  - A. On vaporizers with gravity return type condensate return systems, the filling is done simply by pouring the heat transfer or other organic media into the vaporizer shell using the spare or fill nozzle and, while the filling is taking place, bleeding the displaced air from the vent.
  - B. On vaporizers that use pump condensate return systems or on systems where the condensate is not returned, the filling would be done by first filling the condensate return tank or supply or reservoir tank and then energizing the condensate return or supply pump. While the vaporizer vessel is being filled, the vent nozzle should be opening for bleeding out the air.
2. Set the thermostat at 220°F and/or the controlling pressure switch at its equivalent.
3. To energize the heaters, turn the “on-off” selector switch to the “on” position. The heaters are interlocked with the level or

float switch located on the vessel, so that the heating element will shut off automatically in case of a low liquid level.

4. Operate the vaporizer until 220°F is reached. Periodically open the bleed valves to remove air from the system. At 220°F any moisture that has been trapped in the system will flash into steam and can be bled off through the bleeder valves.

**WARNING:** Avoid having the heat transfer fluid or the fluid to be vaporized spilled or leaked into the pipeline or vessel insulation as it has been found that spontaneous ignition of some of these fluids may result at elevated temperatures.

5. After the vaporizer has been completely charged and free of steam pockets, set the controlling pressure switch or thermostat to the pressure or temperature point where the fluid will vaporize.
6. Operate the vaporizer until this set point is reached. Periodically open the bleeder valves to remove air from the system.
7. After the system is completely free of air, set the controlling pressure switch or thermostat to the desired operating point.

## MAINTENANCE

**CAUTION: Hazard of Severe Shock. Disconnect all power to heater before servicing or replacing heaters.**

1. Heaters should be checked periodically for coatings and corrosion and cleaned if necessary.
2. The tank should be checked regularly for sediment around the heater as sediment can act as an insulator and shorten heater life.
3. Remove any accumulated sludge deposits from heater and from tank.
4. Check for loose terminal connections and tighten if necessary.
