## English

At the recommended height of 2.1m (7ft) ±10%, the OMN-PMD75 motion detectors provide full coverage from 1.5m (5ft) to 11m (35ft). The installation height is measured from the center of the detector (figure 1). All measurements shown in figures are expressed in meters and (feet).

**Avoid bending, cutting or altering the antenna or mounting the detector near or on metal as this may affect signal transmission.**

Avoid placing the detector within proximity of the following sources of interference: reflective surfaces, direct air flow from vents, fans, windows, sources of steam/oil vapor, infrared light sources and objects causing temperature changes such as heaters, refrigerators and ovens.

**Do not touch the sensor surface as this could result in a detector malfunction. If necessary, clean the sensor surface using a soft cloth with pure alcohol.**

## PCB Height Adjustment

The OMN-PMD75 is designed for optimal performance at a height of 2.1m (7ft), but can be installed lower or higher. After you have installed the detector, ensure that the adjustable height markings on the right side of the PCB matches the tab inside the back cover (see "H" in figure 4).

For example, if the detector is installed at a height of 2.1m (7ft), the PCB should then be adjusted to 2.1m (7ft) (figure 1). Align the desired marking (height) with the back cover's plastic tab.

If another installation height is called for, readjust the PCB accordingly. Any PCB adjustments should be followed by a walk-test of the protected area. Walk-testing verifies that the required coverage is in place.

## LED Setting (J5)

This setting enables or disables the red LED (table 1). The red LED will illuminate for a period of 4 seconds to indicate detected movement. The motion detector performs a battery test every 12 hours. If the battery voltage is too low, the red LED will flash at 5-second intervals and the motion detector will send a low battery signal to the Omnia module. The Omnia module then sends the signal to the control panel, which will generate a trouble and can transmit the signal to the monitoring station. The red LED will flash rapidly when the motion detector transmits a signal to the Omnia module.

## Digital Shield™ Setting (J4)

In Normal Shield mode, the detector is set for normal environments. In High Shield mode, the detector is set for high-risk environments (potential interferences) and therefore provides greatly increased false alarm immunity. However, response time and detector speed may be slower. Refer to table 1.

## Single or Dual Edge Processing (J3)

This setting determines the DSP (Digital Signal Processing) operational mode of the detector. Single Edge Processing mode should be used in normal environments with minimal sources of interference. Dual Edge Processing mode provides better false alarm rejection in the case where the detector is placed near sources of interference that can adversely affect the motion detector. Refer to table 1.

## Check-in Supervision Timer (J1, J2)

These two jumpers set the time interval at which the motion detector will communicate a check-in signal. Refer to table 1.

## Powering the Detector

1. Insert three "AAA" batteries into the battery holder while verifying polarity (figure 4).
2. Insert the battery holder into the back cover and affix the battery connector to the PCB (see "A1" and "A2" in figure 4).

**After connecting the battery connector, a power-up sequence will begin (lasting 10 to 30 seconds). During this time, the red LED will flash and the detector will not detect an open zone or tamper.**

## Replacing Batteries

1. Disconnect the battery connector from the PCB. Remove the battery holder and remove the old batteries.
2. Press and release the anti-tamper switch to ensure that the unit has powered down.
3. Follow the steps outlined in "Powering the Detector".

## Walk-testing

Open the cover in order to trigger the anti-tamper switch, then snap the cover back into position. This will activate the motion detector's walk-test mode for 3 minutes. At 20°C (68°F), in Normal Shield (J4 = ON) mode and Single Edge Processing mode (J3 = ON), you should not be able to cross more than one complete zone (consisting of 2 beams, left and right sensor detecting elements) in the coverage area with any kind of movement; slow/fast walking or running.

In High Shield mode, the amount of movement required to generate an alarm is doubled. The approximate width of a full beam at 11m (35ft) from the detector is 1.8m (6ft). When walk-testing, always move across the detection path and not toward the detector.

Walk-test mode is also activated for 3 minutes once the motion detector is powered on.

## Signal Strength Test

In order to verify the receiver's reception of the motion detector's signal, perform a signal strength test before finalizing the installation of the motion detector. Prior to performing the test, make sure the batteries have been inserted into the battery holder to power the detector. Also verify that the motion detector has been assigned to a zone. For more information on signal strength tests and zone programming, refer to the appropriate receiver's Reference and Installation Manual. If the transmission is weak, relocating the transmitter by a few inches can greatly improve the reception.

## Alive Software

If the motion detector transmits 2 alarm signals (LED on for 4 sec.) within a 5-minute period, the detector falls into Energy Save mode where it won't transmit any alarm signals for approximately 3 minutes. Due to the motion detector's Alive Software, the red LED continues to flash to indicate a detection even when in Energy Save mode. Once the 3-minute Energy Save mode ends, the motion detector returns to normal operation.

If the detector's cover is removed and then replaced while in Energy Save mode, the first detection will trigger an alarm signal.

| Technical Specifications  |   |
|---------------------------|---|
| Sensor Type               | two dual opposed infrared sensors                                       |
| Coverage - 90° (standard) | 11m x 11m (35ft x 35ft)   |
| Pet Immunity              | up to 40kg (90lbs)  |
| Detector Speed            | 0.2m to 3.5m/sec. (0.6ft to 11.5ft/sec.)                                |
| Installation Height       | 2.1m to 2.7m (7ft to 9ft)   |
| Operating Temperature     | 0°C to +50°C (+32°F to +122°F)  |
| RF Frequency              | 433* or 868**MHz  |
| Lens                      | 2nd generation Fresnel lens, LODIFF®, segments                          |
| Power                     | 3 X "AAA" alkaline batteries  |
| Transmitter Range         | 150m (500ft)  |
| Anti-Tamper Switch        | yes   |
| Battery Life †            | Lowest check-in setting: 3 years<br>Highest check-in setting: 1.5 years |

\* FCC ID: KDYOMNPM75 Canada: 2438A-OMNPM75  
The OMN-PMD75 complies with part 15 of the FCC rules. Operation is subject to the following two conditions:  
(1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.

\*\* 868MHz (only) (CE) compliant to all EU and EFTA countries except Greece according to RTT&E directives.

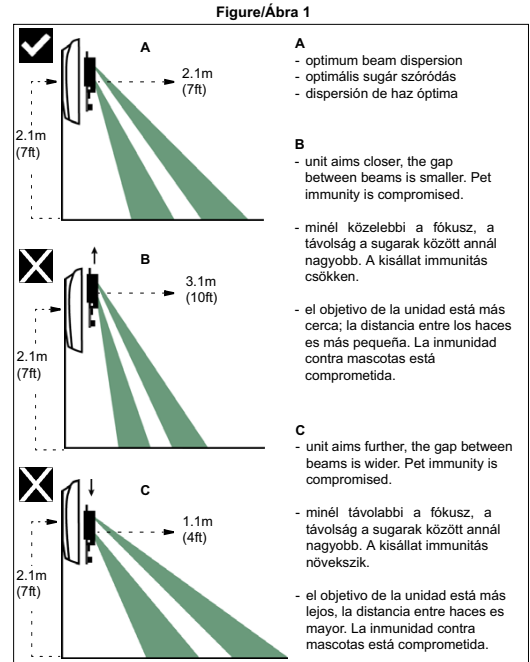

† Battery life expectancy will vary according to the check-in time interval and the amount of traffic (movement) the detector has processed. A higher check-in time interval and higher traffic will lower battery life.

Changes or modifications on equipment not expressly approved by Paradox Security Systems could void the user's authority to operate the equipment.

## Warranty

The Seller warrants its products to be free from defects in materials and workmanship under normal use for a period of one year. Except as specifically stated herein, all express or implied warranties whatsoever, statutory or otherwise, including without limitation, any implied warranty of merchantability and fitness for a particular purpose, are expressly excluded. Because Seller does not install or connect the products and because the products may be used in conjunction with products not manufactured by the Seller, Seller cannot guarantee the performance of the security system. Seller obligation and liability under this warranty is expressly limited to repairing or replacing, at Seller's option, any products not meeting the specifications. In no event shall the Seller be liable to the buyer or any other person for any losses or damages whether direct or indirect or consequential or incidental, including without limitation, any damages for lost profits, stolen goods, or claims by any other party, caused by defective goods or otherwise arising from the improper, incorrect or otherwise faulty installation or use of the merchandise sold.

After changing the jumper settings, snap on the cover to close the anti-tamper switch or press and release the anti-tamper switch in order to save the changes.

A jumper beállítások változtatása után, pattintsa vissza a burkolatot a szabotázskapcsoló zárásához, vagy nyomja le, majd engedje el a szabotázskapcsolót a beállítás mentéséhez.

Después de cambiar la configuración de los puentes, encaje la cubierta en su lugar para cerrar el interruptor antisabotaje o pulse y suelte el interruptor anti-sabotaje para guardar los cambios.
