

# OPERATORS MANUAL FOR ROTAX® ENGINE TYPE 912 SERIES

ref. no.: OM-912 | part no.: 899649

picture: ROTAX<sup>®</sup> 912 ULS with options

### 

Before starting the engine, read the Operators Manual, as it contains important safety relevant information. Failure to do so may result in personal injuries including death. Consult the original equipment manufacturers handbook for additional instructions!

These technical data and the information embodied therein are the property of BRP-Powertrain GmbH&Co KG, Austria, acc, BGBI 1984 no. 448, and shall not, without prior written permission of BRP-Powertrain GmbH&Co KG, be disclosed in whole or in part to third parties. This legend shall be included on any reproduction of these data, in whole or in part. The Manual must remain with the engine/aircraft in case of sale.

 $ROTAX_{\odot}$  is a trade mark of BRP-Powertrain GmbH&Co KG. In the following document the short form of BRP-Powertrain GmbH&Co KG = BRP-Powertrain is used.

Other product names in this documentation are used purely for ease of identification and may be trademarks of the respective company or owner.

Approval of translation has been done to best knowledge and judgement - in any case the original text in german language is authoritative.

## Introduction

Foreword	<ul> <li>BRP-Powertrain provides "Instructions for Continued Airworthiness", which are based on the design, the tests and certification of the engine and its components.</li> <li>These instructions apply only to engines and components supplied by BRP-Powertrain.</li> <li>This Operators Manual contains important information about safe operation of the engine, together with descriptions of the system and its layout, technical data, operating media and the operational limits of the engine.</li> <li>The specified data apply only to the engine and not to specific applications in particular aircraft. The aircraft manufacturer's Operators Manual is therefore definitive in terms of the operation of the engine, as it contains all of the aircraft-specific instructions.</li> </ul>
Chapter structure	The structure of the Manual follows whenever it is possible the

tructure The structure of the Manual follows whenever it is possible the structure of the "GAMA Specification #1 for Pilot's Operating Handbook". The Operators Manual is subdivided into the following chapters:

Subject	Chapter
Introduction	Chapter INTRO
List of effective pages	Chapter LEP)
Table of amendments	Chapter TOA)
General note	Chapter 1)
Operating instructions	Chapter 2)
Standard operation	Chapter 3)
Abnormal operation	Chapter 4)
Performance data	Chapter 5)
Weights	Chapter 6)
Description of systems	Chapter 7)
Checks	Chapter 8)
Supplements	Chapter 9)

NOTES

d05474.fm

# 1) General note

Foreword Before operating the engine, carefully read this Operators Manual. The Manual provides you with basic information on the safe operation of the engine.

If any passages of the Manual are not clearly understood or in case of any questions, please, contact an authorized Distributor or Service Center for ROTAX aircraft engines.

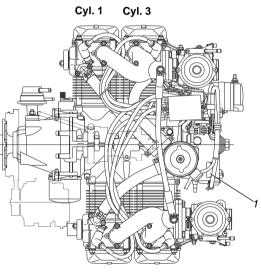

We wish you much pleasure and satisfaction flying your aircraft with this ROTAX engines.

Table of contentThis chapter of the Operators Manual contains general and safety<br/>information concerning the operation of the aircraft engine.

Subject	Page
General note	page 1-1
Abbreviations and terms used in this Manual	page 1-3

### 1.1) General note

Purpose	The purpose of this Operators Manual is provided to familiarize the owner/user of this aircraft engine with basic operating instruc- tions and safety information.
Documentation	For more detailed information regarding, maintenance, safety- or flight operation, consult the documentation provided by the aircraft manufacturer and/or dealer.
	For additional information on engines, maintenance or parts, you can also contact your nearest authorized ROTAX-aircraft engine distributor (Chapter 9.2).
Engine serial num- ber	When making inquiries or ordering parts, always indicate the en- gine serial number, as the manufacturer makes modifications to the engine for product improvement.
	The engine serial number is located on the top of the crankcase, magneto side. See Fig. 1.

# 1.4) Safety notice

Normal use

Non-compliance can result in serious injuries or death!

Never fly the aircraft equipped with this engine at locations, airspeeds, altitudes, or other circumstances from which a successful nopower landing cannot be made, after sudden engine stoppage.

- This engine is not suitable for acrobatics (inverted flight etc.).
- This engine shall not be used on rotorcrafts with an in-flight driven rotor (e.g. helicopters).
- It should be clearly understood that the choice, selection and use of this particular engine on any aircraft is at the sole discretion and responsibility of the aircraft manufacturer, assembler and owner/user.
- Due to the varying designs, equipment and types of aircraft, BRP-Powertrain grants no warranty or representation on the suitability of its engine's use on any particular aircraft. Further, BRP-Powertrain grants no warranty or representation of this engine's suitability with any other part, components or system which may be selected by the aircraft manufacturer, assembler or user for aircraft application.

Non-compliance can result in serious injuries or death!

Unless correctly equipped to provide enough electrical power for night IFR (according latest requirement as ASTM), the ROTAX 912 UL/ULS/ULSFR is restricted to DAY VFR only.

- Certain areas, altitudes and conditions present greater risk than others. The engine may require humidity or dust/sand preventative equipment, or additional maintenance may be required.
- You should be aware that any engine may seize or stall at any time. This could lead to a crash landing and possible severe injury or death. For this reason, we recommend strict compliance with the maintenance and operation and any additional information which may be given to you by your dealer.

Training	- Whether you are a qualified pilot or a novice, complete know- ledge of the aircraft, its controls and operation is mandatory before venturing solo. Flying any type of aircraft involves a cer- tain amount of risk. Be informed and prepared for any situation or hazard associated with flying.
	- A recognized training program and continued education for pi- loting an aircraft is absolutely necessary for all aircraft pilots. Make sure you also obtain as much information as possible about your aircraft, its maintenance and operation from your dealer.
	- Engine-specific training courses are authorized by the distrib- utors according to manufacturer specifications (iRMT).
Regulation	<ul> <li>Respect all government or local rules pertaining to flight operation in your flying area. Fly only when and where conditions, topography, and airspeeds are safest.</li> </ul>
	- Consult your aircraft dealer or manufacturer and obtain the ne- cessary information, especially before flying in new areas.
Instrumentation	<ul> <li>Select and use proper aircraft instrumentation. This instrumentation is not included with the ROTAX engine package.</li> <li>Only approved instrumentation may be installed.</li> </ul>
Engine log book	<ul> <li>Keep an engine log book and respect engine and aircraft maintenance schedules. Keep the engine in top operating condition at all times. Do not operate any aircraft which is not properly maintained or has engine operating irregularities which have not been corrected.</li> </ul>
Maintenance (iRMT)	<ul> <li>Before flight, ensure that all engine controls are operative.</li> <li>Make sure all controls can be easily reached in case of an emergency.</li> </ul>
	- Since special tools and equipment may be required, engine servicing should only be performed by an authorized ROTAX engine dealer. BRP-Powertrain requires that any service be carried out and verified by a technician that has a current iRMT rating.

	<ul> <li>When in storage protect the engine and fuel system from con- tamination and exposure.</li> </ul>
Engine run	- Never operate the engine without sufficient quantities of oper- ating fluids (oil, coolant, fuel).
	- Never exceed the maximum permitted operational limits.
	<ul> <li>In the interest of safety, the aircraft must not be left unattended while the engine is running.</li> </ul>
	<ul> <li>To eliminate possible injury or damage, ensure any loose equipment or tools are properly secured before starting the en- gine.</li> </ul>
	- Allow the engine to cool at idle for several minutes before turn- ing off the engine.
Vacuum pump	- This engine may be equipped with a vacuum pump. The safety warning accompanying the vacuum pump must be given to the owner/operator of the aircraft into which the vacuum pump is installed.

# 1.5) Technical documentation

	ounicitation		
General note	These documents form the instructions ensuring continued air- worthiness of ROTAX aircraft engines. The information contained is based on data and experience that are considered applicable for skilled mechanics under normal conditions. Due to the fast technical progress and fulfilment of particular spec- ifications of the customers it may occur that existing laws, safety prescriptions, constructional and operational regulations cannot be transferred completely to the object bought, in particular for special constructions, or may not be sufficient.		
Documentation	- Installation Manual		
	- Operators Manual		
	- Maintenance Manual (Line and Heavy Maintenance)		
	- Overhaul Manual		
	- Illustrated Parts Catalog		
	- Alert Service Bulletins		
	- Service Bulletins		
	- Service Instructions		
	- Service Letters		
Status	The status of Manuals can be determined with the aid of the table of amendments. The first column indicates the revision state. This figure should be compared with the revision provided on ROTAX-Aircraft Engines Website: <u>www.FLYROTAX.com.</u> Amendments and current versions can be downloaded free of change.		
Revision pages	Furthermore the Manual is constructed in such a way that single pages can be replaced instead of the complete document. The list of effective pages is given in the chapter LEP. The particular edi- tion and revision number is given on the footer of each page.		
Reference	Any reference to a document refers to the latest edition issued by BRP-Powertrain if not stated otherwise.		

Illustrations	pical arrangemer its details but dep	n this Manual are mere sketches and show a ty- it. They may not represent the actual part in all pict parts of the same or similar function. There- dimensions or other details from illustrations is
	NOTE:	The Illustrations in this Manual are stored in a graphic data base system and are provided with a consecutive irrelevant number.
		This number (e.g. 00277) is of no significance for the content.

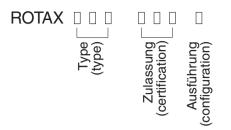

# 1.6) Standard version

Serial production		4-stroke, 4 cylinder horizontally opposed, spark ignition engi- ne, single central cam-shaft - push-rods - OHV		
	- Liquid coole	ed cylinder heads		
	- Ram air coo	bled cylinders		
	- Dry sump for	Dry sump forced lubrication		
	- Dual breake	Dual breakerless capacitor discharge ignition		
	- 2 constant of	depression carburetors		
	- mechanical	fuel pump		
	- Electric star	ter (12 V 0.7 kW)		
	- Integrated A 20 A DC)	AC generator with external rectifier-regulator (12 V		
		ive via integrated gearbox with mechanical shock no overload clutch		
	NOTE:	The overload clutch is installed on all <b>serial</b> <b>production</b> aircraft engines which are certified and on non-certified aircraft engines of the con- figuration 3.		
Optional	- Electric star	ter (12 V 0.9 kW)		
	- External alt	ernator (12 V 40 A DC)		
	- Vacuum pu	mp (only for A1, A2 and A4 possible)		
	<ul> <li>Hydraulic co 3 only)</li> </ul>	onstant speed propeller governor (for configuration		

### 1.7) Type description

e.g. 912 A 2

The type description is made up the following.

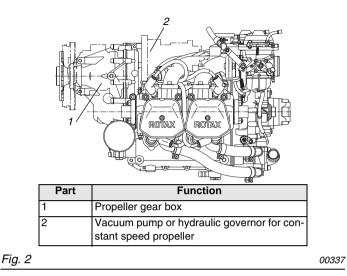

#### Description

<b>a</b> • <i>i</i>		
Designation		Description
Туре:	912	4-cyl. horizontally opposed, nor- mal aspirated engine
Certification:	A	certified to JAR 22 (TC No. EASA.E.121)
	F, S	certified to FAR 33 (TC No. E00051 EN) JAR-E (TC No. EASA.E.121)
	UL, ULS	non-certified aircraft engines
Configuration:	1	Prop shaft with flange for fixed prop, P.C.D 100 mm (3.936 in.).
NOTE: This configuration is not available any longer and will be replaced by configuration 2.		
	2	Prop shaft with flange for fixed pitch propeller.
3 Prop shaft with flange for constar speed propeller and drive for hy- draulic governor for constant speed propeller.		draulic governor for constant
	4	Prop flange for fixed pitch propeller and prepared for retrofit of a hy- draulic governor for constant speed propeller.
NOTE:	NOTE: This configuration 4 is not available any longer and will be replaced by configuration 3.

Effectivity: 912 Series OM Edition 3 / Rev. 0 **BRP-Powertrain** 

page 1-12 September 01/2012 d05475.fm

### 1.9) Technical data

#### See table

Description	912 A/F/UL	912 S/ULS
Bore	79.5 mm (3.13 in)	84 mm (3.31 in)
Stroke	61 mm (2.40 in)	61 mm (2.40 in)
Displacement	1211 cm <sup>3</sup> (73.9 in <sup>3</sup> )	1352 cm <sup>3</sup> (82.5 in <sup>3</sup> )
Compression ratio.	9.0 : 1	11 : 1

### 1.10) Fuel consumption

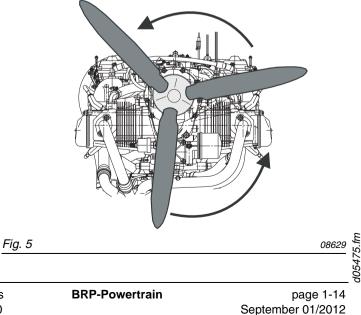

#### See table

Fuel consumption in I/h (US gal/h)	912 A/F/UL	912 S/ULS
At take-off performance	24.0 l/h (6.3 gal/h)	27.0 l/h (7.1 gal/h)
At max. continuous perfor- mance	22.6 l/h (5.6 gal/h)	25.0 l/h (6.6 gal/h)
At 75 % continuous perfor- mance	16.2 l/h (4.3 gal/h)	18.5 l/h (4.9 gal/h)
Specific consumption at max. continuous performance	285 g/kWh (0.47 lb/hph)	285 g/kWh (0.47 lb/hph)

### 1.11) Direction of rotation

Direction of rotation on propeller shaft Direction of rotation on propeller shaft: counter clockwise, looking at p.t.o side of engine.

### normal direction of propeller rotation (engine)

Effectivity: 912 Series OM Edition 3 / Rev. 0

# 2) Operating instructions

The data of the certified engines are based on type certificate of type 912 A JAR 22 (TC No. EASA.E.121), 912 F/S FAR 33 (TC No. E00051 EN), JAR-E (TC No. EASA.E.121).

Table of contentsThis chapter of the Operators Manual contains the operating limits<br/>that must be observed to ensure the ROTAX aircraft engine and<br/>standard systems operate safely.

Permanent monitoring of coolar ature is necessary.	nt temperature and cylinder head temper-	

#### Waterless coolant

### See also Chapter 2.3).

Cylinder head temperature:	
Max.	150 °C (300 °F)
Permanent monitoring of cylinder head temperature is necessary.	

Engir	ne st	art,	oper-
ating	tem	pera	ature

Max.	50 °C (120 °F) (ambient temperature)
Min.	-25 °C (-13 °F) (oil temperature)

Fuel pressure

Non-compliance can result in serious injuries or death!

Exceeding the max. admissible fuel pressure will override the float valve of the carburetor and to engine failure.

The aircraft engine manufacturer strongly recommends the installation of an additional pump, unless this has not been covered by legal obligations so far.

	0.4 bar (5.8 psi) (0.5 bar (7.26 psi))*
Min.	0.15 bar (2.2 psi)

\* applicable only for fuel pump from S/N 11.0036

Propeller gover-			
nor	Power consumption of the hydraulic propeller governor:		
	Max.	600 W	
Vacuum pump	Power consumption of the vacuum pump:		
	Max.	300 W	
External alternator	Power consumption of the external alternator:		
	Max.	1200 W	
Bank angle	Deviation from bank angle:		
	Max.	40°	
	NOTE:	Up to this value the dry sump lubrication system warrants lubrication in every flight situation.

See also Chapter 2.3).

Coolant temperature: (coolant exit temperature)		
Max. 120 °C (248 °F)		
Cylinder head temperature:		
Max. 135 °C (275 °F)		
Permanent monitoring of coolant temperature and cylinder head temper- ature is necessary.		

#### Waterless coolant

Cylinder head temperature:			
Max. 135 °C (275 °F)			
Permanent monitoring of cylinder head temperature is necessary.			

d05476.fm

Engine start, operating temperature

Max.	50 °C (120 °F) (ambient temperature)
Min.	-25 °C (-13 °F) (oil temperature)

**Fuel pressure** 

Non-compliance can result in serious injuries or death!

Exceeding the max. admissible fuel pressure will override the float valve of the carburetor and to engine failure.

The aircraft engine manufacturer strongly recommends the installation of an additional pump, unless this has not been covered by legal obligations so far.

	0.4 bar (5.8 psi) (0.5 bar (7.26 psi))*
Min.	0.15 bar (2.2 psi)

\* applicable only for fuel pump from S/N 11.0036

Propeller gover-			
nor	Power consumption of the hydraulic propeller governor:		
	Max.		600 W
Vacuum pump	Power consumption of the vacuum pump:		
	Max.		300 W

### 2.4) Operating media-Fuel

General note	NOTICE	Obey the local codes and the latest edition of Service Instruction SI-912-016 for the selec- tion of the correct fuel.	
	NOTICE	Use only fuel suitable for the respective cli- matic zone.	
	NOTE:	Risk of vapour formation if using winter fuel for summer operation.	
Knock resistance	The fuels with fo	The fuels with following specifications can be used:	

Fuel specifikationen				
	Usage/Description			
Knock resistance	912 A/F/UL	912 S/ULS		
	Min. RON 90 (min. AKI* 87)	Min. RON 95 (min. AKI* 91)		

Anti Knock Index (RON+MON)/2

\*

#### MOGAS

	Usage/Description		
Mogas	912 A/F/UL	912 S/ULS	
European standard	EN 228 Normal		
	EN 228 Super	EN 228 Super	
	EN 228 Super plus	EN 228 Super plus	

AVGAS AVGAS 100LL places greater stress on the valve seats due to its high lead content and forms increased deposits in the combustion chamber and lead sediments in the oil system. Thus it should only be used in case of problems with vapor lock or when other types of gasoline are unavailable.

	Usage/Description		
AVGAS	912 A/F/UL	912 S/ULS	
Aviation	AVGAS 100 LL	AVGAS 100 LL	
Standard	(ASTM D910)	(ASTM D910)	

# 2.5) Operating media-Lubricants

General note	NOTICE	Obey the manufacturers instructions about the lubricants. If the engine is mainly run on AVGAS more frequent oil changes will be required. See Service Information SI-912-016, latest edi- tion.	
Oil type	e Motorcycle oil of a registered brand with gear add		
	NOTICE	At the selection of suitable lubricants refer to the additional information in the Service Infor- mation SI-912-016, latest edition.	
Oil consumption	Max. 0.06 l/h (0.13 liq pt/h).		
Oil specification	- Use only oil wi	th API classification "SG" or higher!	
	<ul> <li>Due to the high stresses in the reduction gears, oils with gear additives such as high performance motor cycle oils are requi- red.</li> </ul>		
	<ul> <li>Because of the incorporated overload clutch, oils with friction modifier additives are unsuitable as this could result in a slip- ping clutch during normal operation.</li> </ul>		
	<ul> <li>Heavy duty 4-stroke motor cycle oils meet all the require- ments. These oils are normally not mineral oils but semi- or full synthetic oils.</li> </ul>		
	perature prop	or Diesel engines have insufficient high tem- perties and additives which favour clutch are generally unsuitable.	
Oil viscosity	Use of multi-grade oils is recommended.		
		Multi-viscosity grade oils are less sensitive to temperature variations than single grade oils.	
	:	They are suitable for use throughout the sea- sons, ensure rapid lubrication of all engine com- ponents at cold start and get less fluid at higher temperatures.	

#### Table of lubricants

#### See Fig. 1

Since the temperature range of neighboring SAE grades overlap, there is no need for change of oil viscosity at short duration of ambient temperature fluctuations.

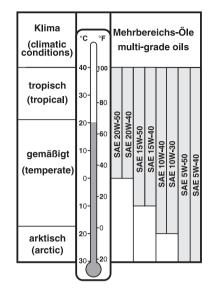

Fig. 1

# 3.1) Daily checks

General note

To warrant reliability and efficiency of the engine, meet and carefully observe all the operating and maintenance instructions.

	Risk of burnings and scalds! Hot engine parts! Conduct checks on the cold engine only!
	Non-compliance can result in serious injuries or death! Ignition "OFF" Before moving the propeller switch off both ig- nition circuit and secure the aircraft. Have the cockpit occupied by a competent person.
NOTICE	If established abnormalities (e.g. excessive resistance of the engine, noise etc.) inspec- tion in accordance with the relevant Mainte- nance Manual is necessary. Do not release the engine into service before rectification.

d05477.fm

NOTICE

The coolant specifications of the section Chapter 2.3) Operating media are to be observed!

Step	Procedure
1	Verify coolant level in the <b>expansion tank</b> , replenish as re- quired up to top. The max. coolant level must be flush with the bottom of the filterneck (see Fig. 1).
2	Verify coolant level in the <b>overflow bottle</b> , replenish as re- quired. The coolant level must be between max. and min. mark.

### Graphic

### Expansion tank

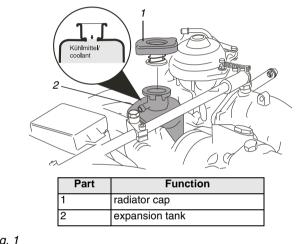

Fig. 1

Step	р	Procedure
1		Turn propeller by hand in direction of engine rotation sev- eral times and observe engine for odd noises or excessive resistance and normal compression.

NOTICE	

At excessive resistance of the engine perform the relevant unscheduled maintenance check according to Maintenance Manual (Line), chapter "Hard to turn over".

# Gear box Version without overload clutch:

No further checks are necessary.

### Version with overload clutch:

Step	Procedure
	Turn the propeller by hand to and fro, feeling the free rota- tion of 30° before the crankshaft starts to rotate.

### Carburetor

Step	Procedure
	Verify free movement of throttle cable and starting carbu- retor over the complete range. Check from the cockpit.

### Exhaust system

Step	Procedure
1	Inspect for damages, leakage and general condition.

# 3.2) Before engine start

Carry out pre-flight checks.

# 3.3) Pre-flight checks

Non-compliance can result in serious injuries or death!
<b>Ignition "OFF"</b> . Before moving the propeller. Switch off both ignition circuits and anchor the aircraft. Have the cockpit occupied by a competent person.
Risk of burnings and scalds! Hot engine parts! Carry out pre-flight checks on the cold or luke warm engine only!

Operating media	rating media Step Procedure	Procedure
	1	Check for any oil-, coolant- and fuel leaks. If leaks are evident, rectify and repair them before next flight.

### Coolant

NOTICE

The coolant specifications of the section Chapter 2.3) Operating media are to be observed!

Step	Procedure
	Verify coolant level in the <b>overflow bottle</b> , replenish as re- quired up to top. The coolant level must be between min. and max. mark.

	Procedure	
Check oil level and replenish as required.		
NOTE:	Propeller shouldn't be turned exces- sively reverse the normal direction of engine rotation.	
Remove oil tank cover, turn the propeller slowly by hand in direction of engine rotation several times to pump oil from the engine into the oil tank.		
It is essential to build up compression in the combustion chamber. Maintain the pressure for a few seconds to let the gas flow via the piston rings into the crankcase. The speed of rotation is not important as the pressure and the amount of gas which is transfered into the crankcase		
This process is finished when air is returning back to the oil tank and can be noticed by a gurgle from the open oil tank.		
Install oil tank o	ap.	
	NOTE: Remove oil tan direction of eng the engine into It is essential to chamber. Maint gas flow via the of rotation is no of gas which is This process is tank and can be	

Oil level (oil dipstick)

NOTE:

The oil level should be in the upper half (between the "50%" and the "max" mark) and should never falls below the "min" mark. Prior to long flights oil should be added so that the oil level reaches the "max" mark.

Avoid oil levels exceeding the "max" mark, since excess oil could be poured out through the venting system.

Difference between max.- and min.- mark = 0.45 litre (0.95 liq pt).

# 3.4) Engine start

Safety

I

Non-compliance can result in serious injuries or death!

Do not take the engine into operation if any person is near the aircraft.

Engine start	Step	Designatio	n	Procedure
	1	Fuel valve		open
	2	Starting carb		activated
		If engine in operating ture	tempera-	Then start the engine without choke
	3	Throttle lever		set to idle position
	4	Master switch		ON
	5	Ignition		both circuits switched on
		NOTICE	long as th	tuate starter button (switch) as ne engine is running. Wait until stop of engine!
	6	Starter button		actuate
		NOTICE	(without ir	starter for max. 10 sec. only nterruption), followed by a cool- I of 2 minutes!
	7	As soon as engine r	uns	adjust throttle to achieve smooth running at approx. 2500 r.p.m
	8	Oil pressure		Check if oil pressure has ris- en within 10 seconds and monitor oil pressure. In- crease of engine speed is only permitted at steady oil pressure readings above 2 bar (30 psi).
	9	NOTICE	ture, cont re as it increased line. The	ine start with low oil tempera- inue to observe the oil pressu- could drop again due to the I flow resistance in the suction number of revolutions may be r increased that the oil pressu- s steady.
	10	Starting carb (choke	)	de-activate

## Reduction gear with shock absorber

NOTICE

Since the engine comprises a reduction gear with shock absorber, take special care of the following:

Step	Procedure		
1	To prevent impact load, start with throttle lever in idle position or at the most up to 10% open.		
2	For the same reason, wait for around 3 sec. af- ter throttling back to partial load to reach con- stant speed before re-acceleration.		
3	For checking the two ignition circuits, only one circuit may be switched off and on at a time.		

# 3.5) Prior to take-off

Safety

Non-compliance can result in serious injuries or death!

Do not take the engine into operation if any person is near the aircraft.

Warming up period

Step	Procedure
1	Start warming up period at approx. 2000 rpm for approx. 2 minutes.
2	Continue at 2500 rpm, duration depending on ambient temperature, until oil temperature reaches 50 °C (120 °F).
3	Check temperatures and pressures.

Throttle response

NOTICE

After a full-load ground test allow a short cooling run to prevent vapour formation in the cylinder head.

Step	Procedure
1	Short full throttle ground test (consult Aircraft Operators Manual since engine speed depends on the propeller used).

Ignition check

Check the two ignition circuits at **4000 rpm** (approx. 1700 rpm propeller).

Step	Procedure		
1	Speed drop with only one ignition circuit must not exceed <b>300 rpm</b> (approx. 130 rpm propeller).		
2	<b>115 rpm</b> (approx. 50 rpm propeller) max. difference of speed by use of either circuit, A or B.		
	NOTE: The propeller speed depends on the actual reduction ratio.		

### Check of hydraulic propeller governor:

nor

Propeller gover-

Check control of the hydraulic propeller governor to specifications of the manufacturer.

NOTE: Cycling the propeller governor puts a relatively high load on the engine. Unnecessary cycling should be avoided.

d05477.fm

3.6) Take-off			
Safety		Non-compliance can result in serious injuries or death!	
	ture and	e the monitor oil temperature, cylinder head tempera- l oil pressure. Limits must not be exceeded! See Chap- Dperating limits.	
	<ul> <li>Respect "cold weather operation" recommendations, see Chapter 3.9).</li> </ul>		
Climb	0	th engine running at take-off performance is permissi- minutes) (see Chapter 2.1).	
3.7) Cruising			
Performance	Step	Procedure	

	1	Set performance as per performance specifications Chapter 5) and respect operating limits as per Chapter 2.1).
Oil temperature	Step	Procedure
	1	Avoid operation below normal operation oil temperature (90 to 110 °C / 194 to 230 °F), as possible formation of condensation water in the lubrication system badly influ- ences the oil quality. To evaporate possibly accumulated condensation water, at least once a day 100 °C (212 °F) oil temperature must be reached.

# 3.8) Engine shut-off

Normally the cooling down of the engine during descending and General note taxiing will be sufficient to allow the engine to be shut off as soon as the aircraft is stopped.

> At increased operating temperatures make an engine cooling run of at least minimum 2 minutes.

# 3.9) Cold weather operation

General note	Generally, an engine service should be carried out before the start of the cold season.		
Coolant	For selection of coolant and mixing ratio, see "Coolant", Chapter 2.3)		
Lubricant	For selection of oil, see table of Lubricants Chapter 2.5).		
Cold start	- With throttle closed and choke activated (open throttle renders starting carb ineffective).		
	- Be aware, no spark below crankshaft speed of 220 rpm (pro- peller speed of 90 rpm).		
	- As performance of electric starter is greatly reduced when hot, limit starting to periods not much longer than 10 sec. With a well charged battery, adding a second battery will not improve cold starts.		
	Remedy - Cold start		

Step	Procedure
1	Use of multigrade oil with the low end viscosity code of 5 or 10.
2	Check the Gap electrode on spark plug or fit new spark plugs according to Maintenance Manual Line.
3	Preheat engine.

Icing in the air intake system

### Icing due to humidity

Carburetor icing due to humidity may occur on the venturi and on the throttle valve due to fuel evaporation and leads to performance loss and change in mixture.

Remedy - Intake air pre-heating is the only effective remedy. See Flight Manual supplied by the aircraft manufacturer. Icing due to water in fuel

### Icing due to water in fuel

NOTICE

Fuels containing alcohol always carry a small amount of water in solution. In case of temperature changes or increase of alcohol content, water or a mixture of alcohol and water may settle and could cause troubles.

Water in fuel will accumulate at the lower parts of the fuel system and leads to freezing of fuel lines, filters or jets.

Remedy

- Use non-contaminated fuel (filtered through suede)
- Generously sized water separators
- Fuel lines routing inclined
- Prevent condensation of humidity, i.e avoid temperature differences between aircraft and fuel.

d05477.fm

# 4) Abnormal operation

# 4.1) Start during flight

Engine stop

If the propeller turns in flight cause of windmilling, but its speed is not sufficient to start the engine, then the electric starter is easilv usable. It is never ever necessary to wait for the standstill of the propeller.

# 4.2) Exceeding of max. admissible engine speed

Exceeding of max. Reduce engine speed. Any exceeding of the max. admissible engine speed engine speed has to be entered by the pilot into the logbook, stating the duration and extend of overspeed.

### 4.3) Exceeding of max. admissible cyl. head temperature

Exceeding of cylinder head temperature

NOTICE

Reduce engine power setting to the minimum necessary to maintain flight and carry out precautionary landing.

- Any exceeding of the max. admissible cylinder head temperature has to be entered by the pilot into the logbook, stating duration and extent of over-temperature condition.
- A maintenance inspection should be carried out.

### 4.4) Exceeding of max. admissible oil temperature

#### Exceeding of oil temperature

NOTICE

Reduce engine power setting to the minimum necessary to maintain flight and carry out precautionary landing.

- Any exceeding of the max. oil temperature must be entered by the pilot in the logbook, stating duration and extent of overtemperature condition.
- A maintenance inspection should be carried out.

# 4.5) Oil pressure below minimum - during flight

Oil pressure below minimum

NOTICE

Reduce engine power setting to the minimum necessary and carry out precautionary landing.

- Check oil system.
- A maintenance inspection should be carried out.

# 4.6) Oil pressure below minimum - on ground

Immediately stop the engine and check for reason. Check oil system.

- Check oil quantity in oil tank.
- Check oil quality. See Chapter 2.5).
- A maintenance inspection should be carried out.

# 4.7) Trouble shooting

Introduction

All checks in accordance with the Maintenance Manual (current issue/revision).

Non-compliance can result in serious injuries or death! Only qualified staff (authorized by the Aviation Authorities) trained on this particular engine, is allowed to carry out maintenance and repair work.

NOTICE

If the following hints regarding remedy do not solve the problem, contact an authorized workshop. The engine must not be operated until the problem is rectified.

Table of content

This chapter of the Operators Manual contains possible cause and remedy in case of trouble shooting.

Subject	Page
Starting problems	page 4-5
Engine run	page 4-5
Oil pressure	page 4-5
Oil level	page 4-6
Engine hard to start at low temperature	page 4-6

105478.fm

### Starting problems

### Engine does not start

Possible cause	Remedy			
Ignition off.	Switch on.			
Closed fuel valve or clogged filter.	Open valve, clean or renew filter, check fuel system for leaks.			
No fuel in tank.	Refuel.			
Starting speed too low, faulty or discharged battery.	Fit fully charged battery.			
Starting speed too low, start problems on cold engine.	Use top quality, low friction oil; allow for sufficient cooling period to counter for performance drop on hot starter; pre- heat engine.			
Wrong fuel (Jetfuel or Diesel).	Check fuel.			

# Engine run Engine idles rough after warm-up period, smoky exhaust emission

Possible cause	Remedy
Starting carb (Choke) activat- ed.	Close starting carb (Choke).

### Engine keeps running with ignition off

Possible cause	Remedy
0 0	Let engine cool down at idling at approx. 2000 rpm.

### Knocking under load

Possible cause	Remedy			
Octane rating of fuel too low.	Use fuel with higher octane rating.			

### Oil pressure

### Low oil pressure

Possible cause	Remedy
Not enough oil in oil tank.	Refill oil.

## Oil level is increasing

Possible cause	Remedy
Oil too cold during engine op- eration.	Cover oil cooler surface, maintain the oil temperature prescribed.
Contamination with diesel fuel.	Check fuel

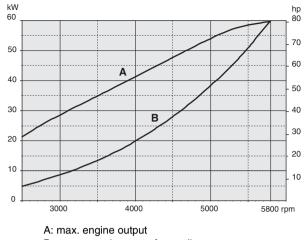

# Cold engine start Engine hard to start at low temperature

Possible cause	Remedy		
Starting speed too low.	Preheat engine.		
Low charge battery.	Fit fully charged battery.		
High oil pressure.	At cold start a pressure reading of up to around 7 bar (102 psi) does not indicate a malfunction.		
Oil pressure too low after cold start.	Too much resistance in the oil suction system at low temperatures due to cold oil. Stop engine and preheat oil. After a cold start the oil tank must be observed and the pressure should be above 1.5 bar (22 psi). Otherwise, the speed must be lowered again, because not enough cold oil can be sucked. If oil pressure is reading lower than 1 bar (15 psi) oils with lower viscosity are to be used. See SI-912-016, current issue.		
	re must be measured at idle at an oil ire of minimum 50 °C (120 °F).		
Be sure th minimum	ne oil pressure does not go below at idle.		

	5) Performance data				
Introduction	The performance tables and performance graphs on the next few pages are intended to show you what kind of performance to ex- pect from your engine in terms of power output. The indicated power can be achieved by following the procedures laid out in the Operators Manual and ensuring that the engine is well-main- tained.				
Table of content	This chapter of the Operators Manual contains performance table and performance graphs.				
	Subject Page				
	Engine type 912 A/F/UL	page 5-2			
	Performance graphs for stand. conditions	page 5-2			
	Performance data for variable pitch propeller page 5-3				
	Performance graph for non-standard conditions page 5-4				
		1			
	Engine type 912 S/ULS	page 5-5

	0 11	page 5-5			

### Performance graphs for stand. conditions (ISA)

Performance graphs Engine 912 A/F/UL

B: power requirement of propeller

### Performance data for variable pitch propeller

Engine speed over 5500 rpm is restricted to 5 minutes.

Run the engine in accordance with the following table.

Power setting	Engine speed (rpm)	Perfor- mance (kW)/(HP)		Torque (Nm) (ft.lb)		Manifold pressure (in.HG)
Take-off power	5800	59.6	80	98.1	72.35 ft.lb	full throttle
max. continous power	5500	58.0	78	100.7	74.27 ft.lb	full throttle
75 %	5000	43.5	58	83.1	61.29 ft.lb	27.2
65 %	4800	37.7	50	75.0	55.32 ft.lb	26.5
55 %	4300	31.9	43	70.8	52.22 ft.lb	26.3
NOTE: Further essential information regarding engine						

Further essential information regarding engine behavior see Service Letter SL-912-016, latest edition.

d05479.fm

### Performance data Engine 912 A/F/UL

### Performance data variable pitch propeller

The following graph shows the performance drop with increasing flight altitude. The curves show the performance at 5800, 5500, 5000, 4500 and 4000 rpm, at full throttle.

At deviation of temperature conditions from standard atmosphere conditions the engine performance to be expected can be calculated from the performance indicated, multiplied by standard temperature, divided by actual temperature in K.

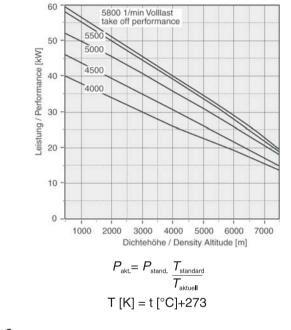

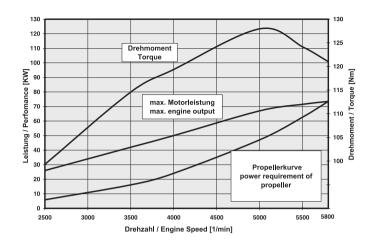

Fig. 3

08635

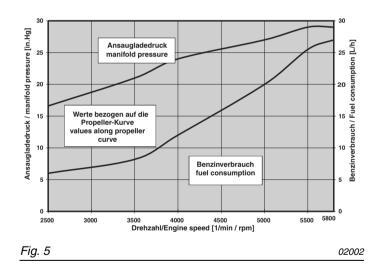

### Performance graphs for stand. conditions (ISA)

### Performance graphs Engine 912 S/ULS

### Performance data Engine 912 S/ULS

### Performance data for variable pitch propeller

Engine speed over 5500 rpm is restricted to 5 minutes.

Run the engine in accordance with the following table.

Power set- ting	Engine speed (rpm)	Perfor- mance (kW)/(HP)	Torque (Nm) (ft.lb)		Manifold pressure (in.HG)
Take-off power	5800	73.5/100	121.0	89.24 ft.lb	27.5
max. contin- uous power	5500	69.0/90	119.8	88.36 ft.lb	27
75 %	5000	51.0/68	97.4	71.84 ft.lb	26
65 %	4800	44.6/60	88.7	65.42 ft.lb	26
55 %	4300	38.0/50	84.3	62.17 ft.lb	24

NOTE:

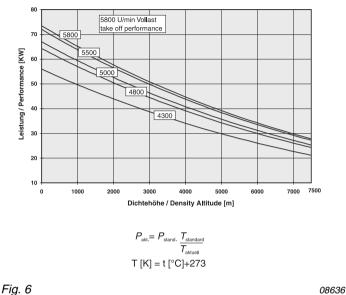

Further essential information regarding engine behavior see Service Letter SL-912-016, latest edition.

Performance graph Engine 912 S/ULS

### Performance graph for non-standard conditions

The following graph shows the performance drop with increasing flight altitude. The curves show the performance at 5800, 5500, 5000, 4800 and 4300 rpm, at full throttle.

At deviation of temperature conditions from standard atmosphere conditions the engine performance to be expected can be calculated from the performance indicated, multiplied by standard temperature, divided by actual temperature in °K.

d05479.fm

NOTES

# 6) Weights

Introduction	The stated weights are dry weights (without operating fluids) and are guide values only. Further weight information relating to the equipment can be found in the current Installation Manual.				
Table of content	This chapter of the Operators Manual contains an extensive list of approved equipment for this engine.				
	Subject	Page			
	Engine	page 6-2			
	Accessories	page 6-2			

## 6.1) Engine

- with: electric starter, carburetors, internal generator, ignition unit and oil tank

Configuration 2

# 7.3) Lubrication system

General note	See Fig. 3
Lubrication	The engines are provided with a dry sump forced lubrication sys- tem with a main oil pump with integrated pressure regulator (1) and oil pressure sensor (2). The oil pump (3) sucks the motor oil from the oil tank (4) via the oil cooler (5) and forces it through the oil filter (6) to the points of lubrication in the engine
Crankcase	The surplus oil emerging from the points of lubrication accumula- tes on the bottom of crankcase and is forced back to the oil tank by the piston blow-by gases.
Oil pump	The oil pumps are driven by the camshaft.
Oil venting system	The oil circuit is vented via bore (7) on the oil tank.
Oil temperature sensor	The oil temperature sensor (8) for reading of the oil inlet tempera- ture is located on the oil pump housing.

Part	Function
1	Pressure regulator
2	Oil pressure sensor
3	Oil pump
4	Oil tank
5	Oil cooler
6	Oil filter
7	Venting tube
8	Oil temperature sensor

# 7.4) Electric system

### General note

### See Fig. 4

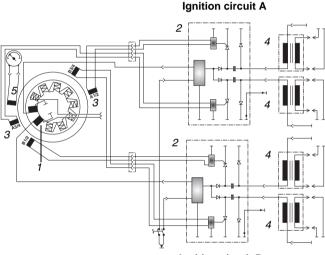

The ROTAX 912 engine is equipped with a dual ignition unit of a breakerless, capacitor discharge design, with an integrated generator.

The ignition unit needs no external power supply.

**Charging coils** Two independent charging coils (1) located on the generator stator supply one ignition circuit each. The energy is stored in capacitors of the electronic modules (2). At the moment of ignition 2 each of the 4 external trigger coils (3) actuate the discharge of the capacitors via the primary circuit of the dual ignition coils (4).

NOTE: The trigger coil (5) is provided for rev counter signal.

Firing order: 1-4-2-3.

## 7.5) Propeller gearbox

General note See Fig. 5

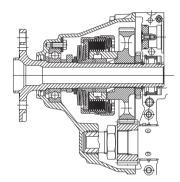

Reduction ratio

For the engine type 912 two reduction ratios are available.

Reduction ratio	912 A/F/UL	912 S/ULS	
crankshaft: propeller shaft	2.27:1	2.43:1	
	2.43:1 (optional)	2.40.1	

**Overload clutch** Depending on engine type, certification and configuration the propeller gearbox is supplied with or without an overload clutch.

NOTE: The overload clutch is installed on serial production on all certified aircraft engines and on the non-certified aircraft engines of configuration 3.

al spring load acting on a dog hub.

	Fig. 5	02531
	NOTE:	Fig. shows a propeller gearbox of configuration 2 with the integrated overload clutch.
Torsional shock absorber	•	incorporates a torsional shock absorber. The shock based on progressive torsional cushioning due to axi-

105481.fm

Backlash	On the gearbox version with overload clutch the design incorpo- rates a friction damped free play at the dogs to warrant proper en- gine idling. Due to this backlash at the dogs a distinct torsional impact arises at start, stop and at sudden load changes, but due to the built-in overload clutch it will remain harmless.					
	NOTE:	This overload clutch will also prevent any undue load to the crankshaft in case of ground contact of the propeller. See Service Letter SL-912-015, latest edition.				
Vacuum pump or hydraulic gover- nor	Alternatively either a vacuum pump <b>or</b> a hydraulic governor for constant speed propeller can be used. The drive is in each case via the propeller reduction gear.					

NOTES

# 8) Checks

Introduction All checks to be carried out as specified in the current Maintenance Manual (last revision).

	Non-compliance can result in serious injuries or death! Only qualified staff (authorized by the Av ation Authorities) trained on this particu- lar engine, is allowed to carry out maintenance and repair work.			
NOTICE	Carry out all directives of Service Bulletins (SB), according to their <b>priority</b> .			
	Observe according Service Instructions (SI) and Service Letter (SL).			

## Table of content

This chapter of the Operators Manual contains checks of the aircraft engines.

Subject	Page
Engine preservation	page 8-2
Engine back to operation	page 8-2

# 8.1) Engine preservation

**General note** 

Risk of burnings and scalds! Hot engine parts! Always allow engine to cool down to ambient temperature before start of any work.

Due to the special material of the cylinder wall, there is no need for extra protection against corrosion for the ROTAX aircraft engines. At extreme climatic conditions and for long out of service periods we recommends the following to protect the valve guides against corrosion:

Step	Procedure					
1	Operate the engine until the temperatures have stabilized for a period of 5 min (engine oil temperature between 50 to 70 $^{\circ}$ C (122 to 160 $^{\circ}$ F).					
2	Switch the engine OFF.					
3	Allow the engine to cool down.					
4	Change oil.					
5	Remove the air intake filters and insert approx. 30 cm <sup>3</sup> (1 fl oz) of corrosion inhibiting oil into the car- buretor throat with the engine running at increased idle speed. Shut off engine.					
6	Drain carburetor float chamber.					
7	Apply oil to all joints on carburetors.					
8	Close <b>all</b> openings on the cold engine, such as exhaust end pipe, venting tube, air filter etc. against entry of dirt and humidity.					
9	Spray all steel external engine parts with corrosion in- hibiting oil.					

# 8.2) Engine back to operation

If preservation (including oil change) took place within a year of storage, oil renewal will not be necessary. For longer storage periods repeat preservation annually.

Step	Procedure						
1	Remove all plugs and caps.						
2	Clean spark plugs with plastic brush and solvent.						
3	Reinstall.						

105482.fm

# 9) Supplement

According to the regulation of EASA part 21 A.3 / FAR 21.3 the Introduction manufacturer shall evaluate field information and report to the authority. In case of any relevant occurrences that may involve malfunction of the engine, the form on the next page should be filled out and sent to the responsible authorized  $ROTAX_{\mathbb{R}}$  distributor. NOTE: The form is also available from the official ROTAX<sub>®</sub> AIRCRAFT ENGINES Website in electronic version. www.FLYROTAX.com Table of content This chapter of the Operators Manual contains the form and the list of authorized distributors for ROTAX aircraft engines. Subject Page

Form	page 9-3
