YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Table of Contents

	About the Documentation	xv
	Documentation and Release Notes	xv
	Supported Platforms	xv
	Using the Examples in This Manual	xv
	Merging a Full Example	xvi
	Merging a Snippet	xvi
	Documentation Conventions	xvii
	Documentation Feedback	xix
	Requesting Technical Support	xix
	Self-Help Online Tools and Resources	xix
	Opening a Case with JTAC	xx
Part 1	Overview	
Chapter 1	SNMP	3
	Understanding the SNMP Implementation in Junos OS	3
	SNMP Architecture	3
	SNMP MIBs	4
	SNMP Traps and Informs	4
	Junos OS SNMP Agent Features	6
	Standard SNMP MIBs Supported by Junos OS	7
	Juniper Networks Enterprise-Specific MIBs	21
	List of SRX100, SRX210, SRX220, SRX240, SRX550, and SRX650 Services	
	Gateways Supported Enterprise-Specific MIBs	28
	List of SRX1400, SRX3400, and SRX3600 Services Gateways Supported	
	Enterprise-Specific MIBs	33
	List of SRX5400, SRX5600 and SRX5800 Services Gateways Supported	
	Enterprise-Specific MIBs	38
	Enterprise-Specific MIBs and Supported Devices	44
	MIB Support Details	54
	SNMP MIB Objects Supported by Junos OS for the Set Operation	63
Chapter 2	SNMPv3	71
	SNMPv3 Overview	71
Chapter 3	SNMP Traps	73
	Juniper Networks Enterprise-Specific SNMP Traps	73
	Standard SNMP Traps Supported on Devices Running Junos OS	73
	Standard SNMP Version 1 Traps	74
	Standard SNMP Version 2 Traps	77
	SNMP Version 2 MPLS Traps	80
	Unsupported Standard SNMP Traps	81

Chapter 4	Routing Instances	85
	Identifying a Routing Instance	85
	Understanding SNMP Support for Routing Instances	86
	Trap Support for Routing Instances	87
Chapter 5	Device Management	89
	Understanding Device Management Functions in Junos OS	89
	Understanding the Integrated Local Management Interface	91
Chapter 6	Remote Operations	93
	SNMP Remote Operations Overview	93
	SNMP Remote Operation Requirements	93
	Setting SNMP Views	93
	Example: Setting SNMP Views	94
	Setting Trap Notification for Remote Operations	94
	Example: Setting Trap Notification for Remote Operations	95
	Using Variable-Length String Indexes	95
	Example: Set Variable-Length String Indexes	95
	Enabling Logging	95
Chapter 7	Remote Monitoring, Health Monitoring, and Service Quality	97
	Understanding RMON Alarms	97
	alarmTable	98
	jnxRmonAlarmTable	98
	Understanding RMON Events	99
	eventTable	99
	Understanding Measurement Points, Key Performance Indicators, and Baseline Values	100
	Measurement Points	100
	Basic Key Performance Indicators	101
	Setting Baselines	101
	Understanding RMON for Monitoring Service Quality	101
	Setting Thresholds	102
	RMON Command-Line Interface	103
	RMON Event Table	103
	RMON Alarm Table	104
	Troubleshooting RMON	104
Part 2	Configuration	
Chapter 8	SNMP	109
	Configuring SNMP on a Device Running Junos OS	109
	Configuring the System Contact on a Device Running Junos OS	112
	Configuring the System Description on a Device Running Junos OS	112
	Configuring the System Location for a Device Running Junos OS	113
	Configuring the System Name	113
	Configuring the Commit Delay Timer	114
	Loading MIB Files to a Network Management System	114
	Filtering Duplicate SNMP Requests	116

	Configuring the Interfaces on Which SNMP Requests Can Be Accepted	117
	Example: Configuring Secured Access List Checking	117
	Filtering Interface Information Out of SNMP Get and GetNext Output	118
	Configuring MIB Views	118
	Example: Ping Proxy MIB	119
	Configuring the Local Engine ID	120
	Configuring SNMP Informs	121
Chapter 9	SNMPv3	123
	Creating SNMPv3 Users	123
	Example: SNMPv3 Configuration	124
	Minimum SNMPv3 Configuration on a Device Running Junos OS	127
	Configuring the SNMPv3 Authentication Type	128
	Configuring MD5 Authentication	129
	Configuring SHA Authentication	129
	Configuring No Authentication	129
	Configuring the Encryption Type	130
	Configuring the Advanced Encryption Standard Algorithm	130
	Configuring the Data Encryption Algorithm	131
	Configuring Triple DES	131
	Configuring No Encryption	131
	Assigning Security Model and Security Name to a Group	132
	Configuring the Security Model	132
	Assigning Security Names to Groups	132
	Configuring the Group	133
	Example: Security Group Configuration	133
	Example: Configuring the Tag List	134
	Example: Creating SNMPv3 Users Configuration	135
Chapter 10	SNMP Traps	137
	Configuring SNMP Trap Options	137
	Configuring the Source Address for SNMP Traps	138
	Configuring the Agent Address for SNMP Traps	140
	Adding snmpTrapEnterprise Object Identifier to Standard SNMP Traps	140
	Configuring the Trap Notification Filter	141
	Configuring SNMP Trap Groups	141
	Configuring SNMP Trap Options and Groups on a Device Running Junos OS	144
	Configuring SNMPv3 Traps on a Device Running Junos OS	145
	Configuring the SNMPv3 Trap Notification	146
	Example: Configuring SNMP Trap Groups	147
	Configuring the Trap Target Address	147
	Configuring the Address	148
	Configuring the Address Mask	148
	Configuring the Port	149
	Configuring the Routing Instance	149
	Configuring the Trap Target Address	149
	Applying Target Parameters	150

	Defining and Configuring the Trap Target Parameters	150
	Applying the Trap Notification Filter	151
	Configuring the Target Parameters	151
	Configuring the Message Processing Model	151
	Configuring the Security Model	152
	Configuring the Security Level	152
	Configuring the Security Name	152
	Example: Configuring SNMPv3 Trap Notification	153
Chapter 11	Access Privileges	155
	Defining Access Privileges for an SNMP Group	155
	Configuring the Access Privileges Granted to a Group	156
	Configuring the Group	156
	Configuring the Security Model	157
	Configuring the Security Level	157
	Associating MIB Views with an SNMP User Group	157
	Configuring the Notify View	158
	Configuring the Read View	158
	Configuring the Write View	159
	Example: Access Privilege Configuration	159
Chapter 12	Routing Instances	161
	Enabling SNMP Access over Routing Instances	161
	Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community	161
	Example: Configuring Interface Settings for a Routing Instance	162
	Configuring Access Lists for SNMP Access over Routing Instances	164
Chapter 13	Community Strings	165
	Configuring the SNMP Community String	165
	Examples: Configuring the SNMP Community String	166
	Adding a Group of Clients to an SNMP Community	167
	Configuring the SNMPv3 Community	168
	Configuring the Community Name	169
	Configuring the Security Names	169
	Configuring the Tag	169
	Example: SNMPv3 Community Configuration	170
Chapter 14	Inform Notifications	171
	Configuring the Inform Notification Type and Target Address	171
	Example: Configuring the Inform Notification Type and Target Address	172
Chapter 15	Remote Operations	175
	Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS	175
Chapter 16	Remote Monitoring, Health Monitoring, and Service Quality	177
	Understanding RMON Alarms and Events Configuration	177
	Configuring an Alarm Entry and Its Attributes	178
	Configuring the Alarm Entry	178
	Configuring the Description	179
	Configuring the Falling Event Index or Rising Event Index	179
	Configuring the Falling Threshold or Rising Threshold	179

	Configuring the Interval	180
	Configuring the Falling Threshold Interval	180
	Configuring the Request Type	180
	Configuring the Sample Type	181
	Configuring the Startup Alarm	181
	Configuring the System Log Tag	181
	Configuring the Variable	182
	Configuring an Event Entry and Its Attributes	182
	Example: Configuring an RMON Alarm and Event Entry	183
	Configuring Health Monitoring on Devices Running Junos OS	183
	Monitored Objects	184
	Minimum Health Monitoring Configuration	185
	Configuring the Falling Threshold or Rising Threshold	185
	Configuring the Interval	186
	Log Entries and Traps	186
	Example: Configuring Health Monitoring	186
Chapter 17	Configuration Statements	189
	Configuration Statements at the [edit snmp] Hierarchy Level	192
	Complete SNMPv3 Configuration Statements	195
	access-list	197
	address	198
	address-mask	198
	agent-address	199
	alarm	200
	authentication-md5	201
	authentication-none	202
	authentication-password	203
	authentication-sha	204
	authorization	205
	categories	206
	client-list	206
	client-list-name	207
	clients	208
	commit-delay	209
	community	210
	community	211
	community-name	212
	contact	213
	description	213
	description	214
	destination-port	214
	engine-id	215
	enterprise-oid	216
	event	216
	falling-event-index	217
	falling-threshold	218
	falling-threshold	219
	falling-threshold-interval	220

filter-duplicates	220
filter-interfaces	221
group (Configuring Group Name)	222
group (Defining Access Privileges for an SNMPv3 Group)	223
health-monitor	223
interface	224
interval	224
interval	225
local-engine	226
location	227
logical-system	228
logical-system-trap-filter	229
message-processing-model	229
name	230
nonvolatile	230
notify	231
notify-filter (Applying to the Management Target)	232
notify-filter (Configuring the Profile Name)	232
notify-view	233
oid	234
oid	235
parameters	236
port	236
privacy-3des	237
privacy-aes128	238
privacy-des	239
privacy-none	240
privacy-password	241
read-view	242
remote-engine	243
request-type	244
retry-count	245
rising-event-index	245
rising-threshold	246
rising-threshold	247
rmon	247
routing-engine (SNMP Resource Level)	248
routing-engine (SNMP Global Level)	249
routing-instance	250
routing-instance	251
routing-instance-access	251
sample-type	252
security-level (Defining Access Privileges)	253
security-level (Generating SNMP Notifications)	254
security-model (Access Privileges)	255
security-model (Group)	256
security-model (SNMP Notifications)	257
security-name (Community String)	258
security-name (Security Group)	259

	security-name (SNMP Notifications)	260
	security-to-group	261
	snmp	261
	source-address	262
	snmp-community	263
	startup-alarm	264
	syslog-subtag	265
	tag	265
	tag-list	266
	target-address	267
	target-parameters	268
	targets	269
	timeout	269
	traceoptions	270
	trap-group	272
	trap-options	273
	type	274
	type	275
	user	276
	usm	277
	v3	279
	vacm	281
	variable	282
	version	282
	view (Associating a MIB View with a Community)	283
	view (Configuring a MIB View)	284
	write-view	285
Part 3	Administration	
Chapter 18	SNMP Traps	289
	Managing Traps and Informs	289
	Generating Traps Based on SysLog Events	289
	Filtering Traps Based on the Trap Category	290
	Filtering Traps Based on the Object Identifier	290
Chapter 19	Remote Operations	293
	Using the Ping MIB for Remote Monitoring Devices Running Junos OS	293
	Configuring the Remote Engine and Remote User	293
	Example: Configuring the Remote Engine ID and Remote Users	294
Chapter 20	Tracing Activity	297
	Tracing SNMP Activity on a Device Running Junos OS	297
	Configuring the Number and Size of SNMP Log Files	298
	Configuring Access to the Log File	298
	Configuring a Regular Expression for Lines to Be Logged	299
	Configuring the Trace Operations	299
	Example: Tracing SNMP Activity	300

Chapter 21	Ping Tests	303
	Starting a Ping Test	303
	Using Multiple Set Protocol Data Units (PDUs)	304
	Using a Single Set PDU	304
	Monitoring a Running Ping Test	304
	pingResultsTable	304
	pingProbeHistoryTable	306
	Generating Traps	307
	Gathering Ping Test Results	307
	Stopping a Ping Test	309
	Interpreting Ping Variables	309
Chapter 22	Operational Commands	311
	show snmp health-monitor	312
	show snmp health-monitor routing-engine history	318
	show snmp health-monitor routing-engine status	322
	show snmp mib (View)	324
Part 4	Index	
	Index	329

About the Documentation

- Documentation and Release Notes on page xv
- Supported Platforms on page xv
- Using the Examples in This Manual on page xv
- Documentation Conventions on page xvii
- Documentation Feedback on page xix
- Requesting Technical Support on page xix

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- [LN Series](#)
- [SRX Series](#)

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

Documentation Conventions

Table 1 on page xvii defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xvii defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	<code>user@host> show chassis alarms</code> <code>No alarms currently active</code>
<i>Italic text like this</i>	- Introduces or emphasizes important new terms. - Identifies guide names. - Identifies RFC and Internet draft titles.	- A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> - RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	- To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level. - The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric metric>;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (string1 string2 string3)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	- In the Logical Interfaces box, select All Interfaces. - To cancel the configuration, click Cancel.

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page at the Juniper Networks Technical Documentation site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>

- Download the latest versions of software and review release notes:
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

Understanding the SNMP Implementation in Junos OS

Supported Platforms [LN Series, M Series, MX Series, PTX Series, SRX Series, T Series](#)

SNMP enables the monitoring of network devices from a central location. This topic provides an overview of SNMP and describes how SNMP is implemented in the Junos OS.

This topic includes the following sections:

- [SNMP Architecture on page 3](#)
- [Junos OS SNMP Agent Features on page 6](#)

SNMP Architecture

The SNMP agent exchanges network management information with SNMP manager software running on a network management system (NMS), or host. The agent responds to requests for information and actions from the manager. The agent also controls access to the agent's MIB, the collection of objects that can be viewed or changed by the SNMP manager.

The SNMP manager collects information about network connectivity, activity, and events by polling managed devices.

Communication between the agent and the manager occurs in one of the following forms:

- **Get, GetBulk, and GetNext** requests—The manager requests information from the agent; the agent returns the information in a **Get** response message.
- **Set** requests—The manager changes the value of a MIB object controlled by the agent; the agent indicates status in a **Set** response message.
- **Traps** notification—The agent sends traps to notify the manager of significant events that occur on the network device.

This topic contains the following sections:

- [SNMP MIBs on page 4](#)
- [SNMP Traps and Informs on page 4](#)

SNMP MIBs

A MIB is a hierarchy of information used to define managed objects in a network device. The MIB structure is based on a tree structure, which defines a grouping of objects into related sets. Each object in the MIB is associated with an object identifier (OID), which names the object. The “leaf” in the tree structure is the actual managed object instance, which represents a resource, event, or activity that occurs in your network device.

MIBs are either standard or enterprise-specific. Standard MIBs are created by the Internet Engineering Task Force (IETF) and documented in various RFCs. Depending on the vendor, many standard MIBs are delivered with the NMS software. You can also download the standard MIBs from the IETF website, www.ietf.org, and compile them into your NMS, if necessary.

For a list of standard supported MIBs, see “[Standard SNMP MIBs Supported by Junos OS](#)” on page 7.

Enterprise-specific MIBs are developed and supported by a specific equipment manufacturer. If your network contains devices that have enterprise-specific MIBs, you must obtain them from the manufacturer and compile them into your network management software.

For a list of Juniper Networks enterprise-specific supported MIBs, see “[Juniper Networks Enterprise-Specific MIBs](#)” on page 21.

SNMP Traps and Informs

Routers can send notifications to SNMP managers when significant events occur on a network device, most often errors or failures. SNMP notifications can be sent as traps or inform requests. SNMP traps are unconfirmed notifications. SNMP informs are confirmed notifications.

SNMP traps are defined in either standard or enterprise-specific MIBs. Standard traps are created by the IETF and documented in various RFCs. The standard traps are compiled into the network management software. You can also download the standard traps from the IETF website, www.ietf.org.

For more information about standard traps supported by the Junos OS, see [“Standard SNMP Traps Supported on Devices Running Junos OS” on page 73](#).

Enterprise-specific traps are developed and supported by a specific equipment manufacturer. If your network contains devices that have enterprise-specific traps, you must obtain them from the manufacturer and compile them into your network management software.

For more information about enterprise-specific traps supported by the Junos OS, see [“Juniper Networks Enterprise-Specific SNMP Traps” on page 73](#). For information about system logging severity levels for SNMP traps, see [“System Logging Severity Levels for SNMP Traps” on page 6](#).

With traps, the receiver does not send any acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. To increase reliability, SNMP informs are supported in SNMPv3. An SNMP manager that receives an inform acknowledges the message with a response. For information about SNMP informs, see [“Configuring SNMP Informs” on page 121](#).

SNMP Trap Queuing

The Junos OS supports trap queuing to ensure that traps are not lost because of temporary unavailability of routes. Two types of queues, destination queues and a throttle queue, are formed to ensure delivery of traps and to control the trap traffic.

The Junos OS forms a destination queue when a trap to a particular destination is returned because the host is not reachable, and adds the subsequent traps to the same destination to the queue. The Junos OS checks for availability of routes every 30 seconds and sends the traps from the destination queue in a round-robin fashion. If the trap delivery fails, the trap is added back to the queue, and the delivery attempt counter and the next delivery attempt timer for the queue are reset. Subsequent attempts occur at progressive intervals of 1 minute, 2 minutes, 4 minutes, and 8 minutes. The maximum delay between the attempts is 8 minutes, and the maximum number of attempts is 10. After 10 unsuccessful attempts, the destination queue and all the traps in the queue are deleted.

The Junos OS also has a throttle mechanism to control the number of traps (**throttle threshold**; default value of 500 traps) sent during a particular time period (**throttle interval**; default of 5 seconds) and to ensure consistency in trap traffic, especially when a large number of traps are generated because of interface status changes. The throttle interval period begins when the first trap arrives at the throttle. All traps within the trap threshold are processed, and the traps beyond the threshold limit are queued. The maximum size of trap queues (that is, the throttle queue and the destination queue combined) is 40,000 traps. However, on EX Series switches, the maximum size of the trap queue is 1000 traps. The maximum size of any one queue is 20,000 traps for devices other than EX Series switches. On EX Series switches, the maximum size of one queue is 500 traps. If a trap is sent from a destination queue when the throttle queue has exceeded the maximum size, the trap is added back to the top of the destination queue, and all subsequent attempts from the destination queue are stopped for a 30-second period, after which the destination queue restarts sending the traps.

NOTE: Users cannot configure the Junos OS for trap queuing. Users cannot view any information about trap queues except what is available in the syslog.

System Logging Severity Levels for SNMP Traps

For some traps, when a trap condition occurs, regardless of whether the SNMP agent sends a trap to an NMS, the trap is logged if the system logging is configured to log an event with that system logging severity level. For more information about system logging severity levels, see the *System Log Monitoring and Troubleshooting Guide for Security Devices*.

For more information about system logging severity levels for standard traps, see [“Standard SNMP Version 1 Traps” on page 74](#) and [“Standard SNMP Version 2 Traps” on page 77](#). For more information about system logging severity levels for enterprise-specific traps, see *Juniper Networks Enterprise-Specific SNMP Version 1 Traps* and *Juniper Networks Enterprise-Specific SNMP Version 2 Traps*.

Junos OS SNMP Agent Features

The Junos OS SNMP agent software consists of an SNMP master agent that delegates all SNMP requests to subagents. Each subagent is responsible for the support of a specific set of MIBs.

The Junos OS supports the following versions of SNMP:

- **SNMPv1**—The initial implementation of SNMP that defines the architecture and framework for SNMP.
- **SNMPv2c**—The revised protocol, with improvements to performance and manager-to-manager communications. Specifically, SNMPv2c implements community strings, which act as passwords when determining who, what, and how the SNMP clients can access the data in the SNMP agent. The community string is contained in SNMP **Get**, **GetBulk**, **GetNext**, and **Set** requests. The agent may require a different community string for **Get**, **GetBulk**, and **GetNext** requests (**read-only** access) than it does for **Set** requests (**read-write** access).
- **SNMPv3**—The most up-to-date protocol focuses on security. SNMPv3 defines a security model, user-based security model (USM), and a view-based access control model (VACM). SNMPv3 USM provides data integrity, data origin authentication, message replay protection, and protection against disclosure of the message payload. SNMPv3 VACM provides access control to determine whether a specific type of access (read or write) to the management information is allowed.

In addition, the Junos OS SNMP agent software accepts IPv4 and IPv6 addresses for transport over IPv4 and IPv6. For IPv6, the Junos OS supports the following features:

- SNMP data over IPv6 networks
- IPv6-specific MIB data
- SNMP agents for IPv6

Standard SNMP MIBs Supported by Junos OS

Supported Platforms [LN Series, SRX Series](#)

Table 3 on page 7 contains the list of standard SNMP MIBs and RFCs that are supported on various devices running Junos OS. RFCs can be found at <http://www.ietf.org>.

NOTE: In this table, a value of 1 in any of the platform columns (M, T, J, MX, EX, and SRX) denotes that the corresponding MIB is supported on that particular platform, and a value of 0 denotes that the MIB is not supported on the platform.

Table 3: Standard MIBs Supported on Devices Running Junos OS

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
IEEE 802.1ab section 12.1, <i>Link Layer Discovery Protocol (LLDP) MIB</i>	0	0	0	0	1	0		
Supported tables and objects:								
• <code>lldpRemManAddrOID</code>, <code>lldpLocManAddrOID</code>, <code>lldpReinitDelay</code>, <code>lldpNotificationInterval</code>, <code>lldpStatsRxPortFramesDiscardedTotal</code>, <code>lldpStatsRxPortFramesError</code>, <code>lldpStatsRxPortTLVsDiscardedTotal</code>, <code>lldpStatsRxPortTLVsUnrecognizedTotal</code>, <code>lldpStatsRxPortAgeoutsTotal</code>								

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
IEEE, 802.3ad, <i>Aggregation of Multiple Link Segments</i>	1	1	1	1	1	1	1	1
Supported tables and objects:								
- dot3adAggPortTable, dot3adAggPortListTable, dot3adAggTable, and dot3adAggPortStatsTable NOTE: EX Series switches do not support the dot3adAggPortTable and dot3adAggPortStatsTable. - dot3adAggPortDebugTable (only dot3adAggPortDebugRxState, dot3adAggPortDebugMuxState, dot3adAggPortDebugActorSyncTransitionCount, dot3adAggPortDebugPartnerSyncTransitionCount, dot3adAggPortDebugActorChangeCount, and dot3adAggPortDebugPartnerChangeCount) NOTE: EX Series switches do not support the dot3adAggPortDebugTable. - dot3adTablesLastChanged								
RFC 1155, <i>Structure and Identification of Management Information for TCP/IP-based Internets</i>	1	1	1	1	1	1	1	1
RFC 1157, <i>A Simple Network Management Protocol (SNMP)</i>	1	1	1	1	1	1	1	1
RFC 1195, <i>Use of OSI IS-IS for Routing in TCP/IP and Dual Environments</i> (only the objects isisSystem, isisMANAreaAddr, isisAreaAddr, isisSysProtSupp, isisSummAddr, isisCirc, isisCircLevel, isisPacketCount, isisISAdj, isisISAdjAreaAddr, isisAdjIPAddr, isisISAdjProtSupp, isisRa, and isisIPRA are supported)	1	1	1	1	1	1	1	1
RFC 1212, <i>Concise MIB Definitions</i>	1	1	1	1	1	0	0	1

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
RFC 1213, <i>Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II</i> . Junos OS supports the following areas:	1	1	1	1	1	0	0	1
- MIB II and its SNMP version 2 derivatives, including: - Statistics counters - IP, except for ipRouteTable, which has been replaced by ipCidrRouteTable (RFC 2096, <i>IP Forwarding Table MIB</i>) - SNMP management - Interface management - SNMPv1 Get, GetNext requests, and version 2 GetBulk request - Junos OS-specific secured access list - Master configuration keywords - Reconfigurations upon SIGHUP								
RFC 1215, <i>A Convention for Defining Traps for use with the SNMP</i> (only MIB II SNMP version 1 traps and version 2 notifications)	1	1	1	1	1	0	0	1
RFC 1406, <i>Definitions of Managed Objects for the DS1 and E1 Interface Types</i> (T1 MIB is supported)	1	1	1	0	0	1	0	0
RFC 1407, <i>Definitions of Managed Objects for the DS3/E3 Interface Type</i> (T3 MIB is supported)	1	1	1	0	0	0	0	0
RFC 1471, <i>Definitions of Managed Objects for the Link Control Protocol of the Point-to-Point Protocol</i> (only pppLink group is supported. The pppLink group consists of the pppLcp 1 object and the tables pppLinkStatustable and pppLinkConfigTable).	1	0	0	1	0	0	0	0
RFC 1657, <i>Definitions of Managed Objects for the Fourth Version of the Border Gateway Protocol (BGP-4) using SMIv2</i>	1	1	1	1	1	0	0	0
RFC 1695, <i>Definitions of Managed Objects for ATM Management Version 8.0 Using SMIv2</i>	1	1	1	0	0	0	0	0

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
RFC 1850, <i>OSPF Version 2 Management Information Base</i> (except for the ospfOriginateNewLsas and ospfRxNewLsas objects, the Host Table, and the traps ospfOriginateLSA , ospfLsdbOverflow , and ospfLsdbApproachingOverflow)	1	1	1	1	1	1	0	0
RFC 1901, <i>Introduction to Community-based SNMPv2</i>	1	1	1	1	1	1	1	1
RFC 2011, <i>SNMPv2 Management Information Base for the Internet Protocol Using SMIv2</i>	1	1	1	1	1	0	0	0
RFC 2012, <i>SNMPv2 Management Information Base for the Transmission Control Protocol Using SMIv2</i>	1	1	1	1	1	1	0	1
RFC 2013, <i>SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2</i>	1	1	1	1	1	1	0	1
RFC 2096, <i>IP Forwarding Table MIB</i> (The ipCidrRouteTable has been extended to include the tunnel name when the next hop is through an RSVP-signaled LSP.)	1	1	1	1	1	0	0	1
RFC 2115, <i>Management Information Base for Frame Relay DTEs Using SMIv2</i> (frDlcmiTable only; frCircuitTable and frErrTable are not supported)	1	1	1	1	0	1	0	0
RFC 2233, <i>The Interfaces Group MIB Using SMIv2</i> NOTE: RFC 2233 has been replaced by RFC 2863, IF MIB. However, Junos OS supports both RFC 2233 and RFC 2863.	1	1	1	1	1	1	0	1
RFC 2287, <i>Definitions of System-Level Managed Objects for Applications</i> (only the objects sysApplInstallPkgTable , sysApplInstallElmtTable , sysApplElmtRunTable , and sysApplMapTable)	1	1	1	1	1	1	0	1
RFC 2465, <i>Management Information Base for IP Version 6: Textual Conventions and General Group</i> (except for IPv6 interface statistics)	1	1	1	1	0	1	0	0

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
RFC 2495, <i>Definitions of Managed Objects for the DS1, E1, DS2, and E2 Interface Types</i> (except for <code>dsx1FarEndConfigTable</code> , <code>dsx1FarEndCurrentTable</code> , <code>dsx1FarEndIntervalTable</code> , <code>dsx1FarEndTotalTable</code> , and <code>dsx1FracTable</code>)	1	1	1	0	0	1	0	0
RFC 2515, <i>Definitions of Managed Objects for ATM Management</i> (except <code>atmVpCrossConnectTable</code> , <code>atmVcCrossConnectTable</code> , and <code>aal5VccTable</code>)	1	1	1	0	0	0	0	0
RFC 2570, <i>Introduction to Version 3 of the Internet-standard Network Management Framework</i>	1	1	1	1	1	0	0	1
RFC 2571, <i>An Architecture for Describing SNMP Management Frameworks</i> (read-only access) NOTE: RFC 2571 has been replaced by RFC 3411. However, Junos OS supports both RFC 2571 and RFC 3411.	1	1	1	1	1	1	0	1
RFC 2572, <i>Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)</i> (read-only access) NOTE: RFC 2572 has been replaced by RFC 3412. However, Junos OS supports both RFC 2572 and RFC 3412.	1	1	1	1	1	1	0	1
RFC 2576, <i>Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework</i> NOTE: RFC 2576 has been replaced by RFC 3584. However, Junos OS supports both RFC 2576 and RFC 3584.	1	1	1	1	1	1	0	1
RFC 2578, <i>Structure of Management Information Version 2 (SMIv2)</i>	1	1	1	1	1	0	0	1
RFC 2579, <i>Textual Conventions for SMIv2</i>	1	1	1	1	1	0	0	1
RFC 2580, <i>Conformance Statements for SMIv2</i>	1	1	1	1	1	0	0	1
RFC 2662, <i>Definitions of Managed Objects for ADSL Lines</i> All MIB tables, objects, and traps are applicable for the ADSL ATU-R agent.)	1	1	1	1	0	1	0	0

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
RFC 2665, <i>Definitions of Managed Objects for the Ethernet-like Interface Types</i>	1	1	1	1	1	1	0	1
RFC 2787, <i>Definitions of Managed Objects for the Virtual Router Redundancy Protocol</i> (except row creation, the Set operation, and the object vrpStatsPacketLengthErrors)	1	1	1	1	1	1	0	1
RFC 2790, <i>Host Resources MIB</i>	1	1	1	1	1	1	0	1
- Only the hrStorageTable. The file systems /, /config, /var, and /tmp always return the same index number. When SNMP restarts, the index numbers for the remaining file systems might change. - Only the objects of the hrSystem and hrSWInstalled groups.								
RFC 2819, <i>Remote Network Monitoring Management Information Base</i>	1	1	1	1	1	1	0	1
etherStatsTable (for Ethernet interfaces only), alarmTable, eventTable, and logTable are supported on all devices running Junos OS. historyControlTable and etherHistoryTable (except etherHistoryUtilization object) are supported only on EX Series switches.								
RFC 2863, <i>The Interfaces Group MIB</i>	1	1	1	1	1	0	0	1
NOTE: RFC 2863 replaces RFC 2233. However, Junos OS supports both RFC 2233 and RFC 2863.								
RFC 2864, <i>The Inverted Stack Table Extension to the Interfaces Group MIB</i>	1	1	1	1	0	0	0	1
RFC 2922, <i>The Physical Topology (PTOPO) MIB</i>	0	0	0	0	1	1	0	1
Supported objects:								
ptopoConnDiscAlgorithm , ptopoConnAgentNetAddrType , ptopoConnAgentNetAddr , ptopoConnMultiMacSASeen , ptopoConnMultiNetSASeen , ptopoConnIsStatic , ptopoConnLastVerifyTime , ptopoConnRowStatus								

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
RFC 2925, <i>Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations</i> (only the objects <code>pingCtlTable</code> , <code>pingResultsTable</code> , <code>pingProbeHistoryTable</code> , <code>pingMaxConcurrentRequests</code> , <code>traceRouteCtlTable</code> , <code>traceRouteResultsTable</code> , <code>traceRouteProbeHistoryTable</code> , and <code>traceRouteHopsTable</code>)	1	1	1	1	1	1	0	1
RFC 2932, <i>IPv4 Multicast Routing MIB</i>	1	1	1	1	1	1	0	1
RFC 2933, <i>Internet Group Management Protocol (IGMP) MIB</i>	1	1	1	1	1	1	0	0
RFC 2934, <i>Protocol Independent Multicast MIB for IPv4</i>	1	1	1	1	1	1	0	0
NOTE: In Junos OS, RFC 2934 is implemented based on a draft version, <i>pimmib.mib</i>, of the now standard RFC. Support for the <code>pimNeighborLoss</code> trap was added in Release 11.4.								
RFC 2981, <i>Event MIB</i>	1	1	1	1	0	0	0	0
RFC 3014, <i>Notification Log MIB</i>	1	1	1	1	0	0	0	0
RFC 3019, <i>IP Version 6 Management Information Base for The Multicast Listener Discovery Protocol</i>	1	1	1	1	0	0	0	1
RFC 3410 <i>Introduction and Applicability Statements for Internet-Standard Management Framework</i>	1	1	1	1	1	0	0	1
RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i>	1	1	1	1	1	0	0	1
NOTE: RFC 3411 replaces RFC 2571. However, Junos OS supports both RFC 3411 and RFC 2571.								
RFC 3412, <i>Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)</i>	1	1	1	1	1	0	0	1
NOTE: RFC 3412 replaces RFC 2572. However, Junos OS supports both RFC 3412 and RFC 2572.								

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX

RFC 3637, <i>Definitions of Managed Objects for the Ethernet WAN Interface Sublayer</i> (except etherWisDeviceTable , etherWisSectionCurrentTable , and etherWisFarEndPathCurrentTable)	1	1	1	1	0	0	0	0
RFC 3811, <i>Definitions of Textual Conventions (TCs) for Multiprotocol Label Switching (MPLS) Management</i>	1	1	1	1	0	1	0	0

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
RFC 3812, <i>Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Management Information Base (MIB)</i> (read only access) - MPLS tunnels as interfaces are not supported. - The following objects in the TunnelResource table are not supported: mplsTunnelResourceMeanRate, mplsTunnelResourceMaxBurstSize, mplsTunnelResourceMeanBurstSize, mplsTunnelResourceExBurstSize, mplsTunnelResourceWeight. mplsTunnelPerfTable and mplsTunnelCRLDResTable are not supported. mplsTunnelCHopTable is supported on ingress routers only. NOTE: The branch used by the proprietary LDP MIB (ldpmib.mib) conflicts with RFC 3812. ldpmib.mib has been deprecated and replaced by jnx-mpls-ldp.mib.	1	1	1	1	0	0	0	0
RFC 3813, <i>Multiprotocol Label Switching (MPLS) Label Switching Router (LSR) Management Information Base (MIB)</i> (read-only access). mplsInterfacePerfTable , mplsInSegmentPerfTable , mplsOutSegmentPerfTable , mplsInSegmentMapTable , mplsXCUp , and mplsXCDown are not supported.	1	1	1	1	0	1	0	0
RFC 3826, <i>The Advanced Encryption Standard (AES) Cipher Algorithm in the SNMP User-based Security Model</i>	1	1	1	1	1	0	0	1
RFC 3896, <i>Definitions of Managed Objects for the DS3/E3 Interface Type</i> (except dsx3FarEndConfigTable , dsx3FarEndCurrentTable , dsx3FarEndIntervalTable , dsx3FarEndTotalTable , and dsx3FracTable)	1	1	1	0	0	0	0	0

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
RFC 4188, <i>Definitions of Managed Objects for Bridges</i> —Supports 802.1D STP(1998). Supports only the following subtrees and objects:	0	0	0	1	1	0	0	0
dot1dStp subtree is supported on MX Series 3D Universal Edge Routers. dot1dTpFdbAddress, dot1dTpFdbPort, and dot1dTpFdbStatus objects from the dot1dTpFdbTable of the dot1dTp subtree are supported on EX Series Ethernet Switches.								
NOTE: dot1dTpLearnedEntryDiscards and dot1dTpAgingTime objects are supported on M and T Series routers.								
RFC 4318, <i>Definitions of Managed Objects for Bridges with Rapid Spanning Tree Protocol</i> —Supports 802.1w and 802.1t extensions for RSTP.	1	1	1	1	1	0	0	0
RFC 4363b, <i>Q-Bridge VLAN MIB</i>	0	0	0	1	1	0	0	0
RFC 4382 <i>MPLS/BGP Layer 3 Virtual Private Network (VPN) MIB</i>	1	1	1	1	1	0	0	0
The Junos OS support for RFC 4382 includes the following scalar objects and tables:								
mplsL3VpnConfiguredVrfs mplsL3VpnActiveVrfs mplsL3VpnConnectedInterfaces mplsL3VpnNotificationEnable mplsL3VpnVrfConfMaxPossRts mplsL3VpnVrfConfRteMxThrshTime mplsL3VpnI1L3LbRcvThrsh mplsL3VpnVrfTable mplsL3VpnIfConfTable mplsL3VpnVrfPerfTable mplsL3VpnVrfRteTable mplsVpnVrfRTTable								
RFC 4444, <i>IS-IS MIB</i>	1	1	1	1	1	1	0	0
RFC 4668, <i>RADIUS Accounting Client Management Information Base (MIB) for IPv6</i> (read-only access)	0	0	0	1	0	0	0	0

Table 3: Standard MIBs Supported on Devices Running Junos OS (*continued*)

MIB/RFC	Platforms							
	M	T	J	MX	EX	SRX		
						Low-End	Mid-Range	High-End
RFC 4670, <i>RADIUS Accounting Client Management Information Base (MIB)</i> (read-only access)	0	0	0	1	0	0	0	0
RFC 4801, <i>Definitions of Textual Conventions for Generalized Multiprotocol Label Switching (GMPLS) Management Information Base (MIB)</i> (read-only access)	1	1	1	1	0	0	0	0
RFC 4802, <i>Generalized Multiprotocol Label Switching (GMPLS) Traffic Engineering (TE) Management Information Base (MIB)</i> (read-only access). gmplsTunnelReversePerfTable , gmplsTeScalars , gmplsTunnelTable , gmplsTunnelARHopTable , gmplsTunnelCHopTable , and gmplsTunnelErrorTable are not supported.)	1	1	1	1	0	0	0	0
RFC 4803, <i>Generalized Multiprotocol Label Switching (GMPLS) Label Switching Router (LSR) Management Information Base (MIB)</i> (read-only access). gmplsLabelTable and gmplsOutsegmentTable are not supported.	1	1	1	1	0	0	0	0
NOTE: The tables in GMPLS TE (RFC 4802) and LSR (RFC 4803) MIBs are extensions of the corresponding tables from the MPLS TE (RFC 3812) and LSR (RFC 3813) MIBs and use the same index as the MPLS MIB tables.

- [Loading MIB Files to a Network Management System on page 114](#)

Juniper Networks Enterprise-Specific MIBs

Supported Platforms [LN Series, SRX Series](#)

The Junos OS supports the following enterprise-specific MIBs:

- AAA Objects MIB—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-user-aaa.txt

For more information, see *AAA Objects MIB*.

- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-auth.txt.

For more information, see *Access Authentication Objects MIB*.

- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis-alarm.txt.

For more information, see *Alarm MIB*.

- ATM Class-of-Service MIB—Provides support for monitoring Asynchronous Transfer Mode, version 2 (ATM2) virtual circuit (VC) class-of-service (CoS) configurations. It also provides CoS queue statistics for all VCs that have CoS configured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-atm-cos.txt

For more information, see *ATM Class-of-Service MIB*.

- ATM MIB—Provides support for ATM interfaces and virtual connections. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-atm.txt.

For more information, see *ATM MIB*.

- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, *Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version*. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-bgpmib2.txt.

For more information, see *BGP4 V2 MIB*.

- Bidirectional Forwarding Detection MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-bfd.txt.

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis Definitions for Router Model MIB—Contains the object identifiers (OIDs) that are used by the Chassis MIB to identify platform and chassis components. The Chassis MIB provides information that changes often, whereas the Chassis Definitions for Router Model MIB provides information that changes less often. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chas-defines.txt.

For more information, see *Chassis MIBs*.

- Chassis Forwarding MIB—This MIB extends the scope of health monitoring to include Junos forwarding process (**fwdd**) components. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis-fwdd.txt.

For more information, see *Chassis Forwarding MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switch Board (SSB), Switching and Forwarding Module (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis.txt.

For more information, see *Chassis MIBs*.

- Chassis Cluster MIB—Provides information about objects that are used whenever the state of the control link interfaces or fabric link interfaces changes (up to down or down to up) in a chassis cluster deployment. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-jsrpd.txt.

For more information, see *Chassis Cluster MIB*.

- Class-of-Service MIB—Provides support for monitoring interface output queue statistics per interface and per forwarding class. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-cos.txt.

For more information, see *Class-of-Service MIB*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in `jnxCmChgEventTable`. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-cfgmgmt.txt.

For more information, see *Configuration Management MIB*.

- Destination Class Usage MIB—Provides support for monitoring packet counts based on the ingress and egress points for traffic transiting your networks. Ingress points are identified by the input interface. Egress points are identified by destination prefixes grouped into one or more sets, known as destination classes. One counter is managed per interface per destination class, up to a maximum of 16 counters per interface. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-dcu.txt.

For more information, see *Destination Class Usage MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-dns.txt.

For more information, see *DNS Objects MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-event.txt.

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-firewall.txt.

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage format. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-hostresources.txt.

For more information, see *Host Resources MIB*.

- IDP Objects MIB—Provides support for monitoring SNMP IDP queries, requests, responses, and failures. This MIB defines the key monitoring and threshold crossing trap support, IDP database update status and trap support, attack-related monitoring and trap support for all SRX Series devices. This MIB models IDP attributes specific to the appropriate Juniper Networks implementation. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-idp.txt.

For more information, see *IDP MIB*.

- Interface MIB—Extends the standard **ifTable** (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-if-extensions.txt.

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipforward.txt.

For more information, see *IP Forward MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt.

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt.

For more information, see *IPsec Monitoring MIB*.

- IPsec VPN Objects MIB—Provides support for monitoring IPsec and IPsec VPN management objects for Juniper security product lines. This MIB is an extension of **jnx-ipsec-flow-mon.mib**. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-ipsec-vpn.txt.

For more information, see *IPsec VPN Objects MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipv4.txt.

For more information, see *IPv4 MIB*.

- IPv6 and ICMPv6 MIB—Provides IPv6 and Internet Control Message Protocol version 6 (ICMPv6) statistics. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipv6.txt.

For more information, see *IPv6 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-license.txt.

For more information, see *License MIB*.

- Logical Systems MIBs—Extend SNMP support to logical systems security profile through various MIBs defined under **jnxLsysSecurityProfile**. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt.

For more information about logical systems MIBs and downloadable versions of the MIBs, see *Logical Systems MIB*.

- NAT Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-nat.txt.

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-pfe.txt.

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in **pingCtlTable** of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ping.txt.

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-policy.txt.

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-rpf.txt.

NOTE: The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- RMON Events and Alarms MIB—Supports the Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments **alarmTable** with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-rmon.txt.

For more information, see *RMON Events and Alarms MIB*.

- Security Interface Extension Objects MIB—Provides support for the security management of interfaces. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-if-ext.txt.

For more information, see *Security Interface Extension Objects MIB*.

- Security Screening Objects MIB—Defines the MIB for the Juniper Networks Enterprise Firewall screen functionality. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-screening.txt.

For more information, see *Security Screening Objects MIB*.

- Source Class Usage MIB—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-scu.txt.

For more information, see *Source Class Usage MIB*.

- SPU Monitoring MIB—Provides support for monitoring SPUs on all high-end SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt.

For more information, see *SPU Monitoring Objects MIB*.

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for SRX Series devices, services, and traps. This MIB is currently supported by Junos OS for SRX Series devices only.

Explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-smi.txt.

For more information, see *Structure of Management Information MIB*.

- System Log MIB—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-syslog.txt.

For more information, see *System Log MIB*.

- Traceroute MIB—Supports the Junos OS extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the **traceRouteCtlTable** of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-traceroute.txt.

For more information, see *Traceroute MIB*.

- Utility MIB—Provides SNMP support for exposing Junos OS data and has tables that contain information about each type of data, such as integer and string. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-util.txt.

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-cert.txt.

For more information, see *VPN Certificate Objects MIB*.

- VPN MIB—Provides monitoring for Layer 3 VPNs, Layer 2 VPNs, and virtual private LAN service (VPLS) (read access only). For a downloadable version of the MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-vpn.txt.

For more information, see *VPN MIB*.

List of SRX100, SRX210, SRX220, SRX240, SRX550, and SRX650 Services Gateways Supported Enterprise-Specific MIBs

Supported Platforms [LN Series, SRX100, SRX110, SRX210, SRX220, SRX240, SRX550, SRX650](#)

Junos OS supports the following enterprise-specific MIBs:

- Structure of Management Information MIB—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for SRX Series devices product, services and traps. This MIB is currently supported only by Junos OS for SRX Series devices. It also explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-smi.txt. For more information, see *Structure of Management Information MIB*.
- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-auth.txt.

For more information, see *Access Authentication Objects MIB*.

- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis-alarm.txt.

For more information, see *Alarm MIB*.

- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-bgpmib2.txt . .

For more information, see *BGP4 V2 MIB*.

- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-bfd.txt ..

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis.txt . .

For more information, see *Chassis MIBs*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-cfgmgmt.txt . .

For more information, see *Configuration Management MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inOctets**, **inFrames**, **outOctets**, and **outFrames** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-mac.txt .

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-event.txt . .

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-firewall.txt . .

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-hostresources.txt . .

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard IfTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-if-extensions.txt . .

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipforward.txt . .

For more information, see *IP Forward MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt .

For more information, see *IPsec Monitoring MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt . .

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipv4.txt . .

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-license.txt ..

For more information, see *License MIB*.

- Network Address Translation (NAT) Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-nat.txt . .

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-pfe.txt . .

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ping.txt . .

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-policy.txt . .

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-rpf.txt . .

NOTE: The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- RMON Events and Alarms MIB—Supports the Junos extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments alarmTable with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-rmon.txt . .

For more information, see *RMON Events and Alarms MIB*.

- Security Interface Extension Objects MIB—Provides support for the security management of interfaces. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-if-ext.txt . .

For more information, see *Security Interface Extension Objects MIB*.

- SNMP IDP Objects MIB—Provides support for monitoring SNMP IDP queries, requests, responses, and failures. This MIB defines the key monitoring and threshold crossing trap support, IDP database update status and trap support, attack-related monitoring and trap support for SRX100, SRX110, SRX210, SRX220, SRX240, SRX550, and SRX650 Services Gateways. This MIB models IDP attributes specific to the appropriate Juniper Networks implementation. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-idp.txt .

For more information, see *SNMP IDP MIB*.

- System Log MIB—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-syslog.txt . .

For more information, see *System Log MIB*.

- Traceroute MIB—Supports the Junos extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the traceRouteCtlTable of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-traceroute.txt . .

For more information, see *Traceroute MIB*.

- Utility MIB—Provides SNMP support for exposing Junos data and has tables that contain information on each type of data, such as integer and string. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-util.txt . .

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-cert.txt . .

For more information, see *VPN Certificate Objects MIB*.

List of SRX1400, SRX3400, and SRX3600 Services Gateways Supported Enterprise-Specific MIBs

Supported Platforms LN Series, SRX1400, SRX3400, SRX3600

Junos OS supports the following enterprise-specific MIBs:

- **Structure of Management Information MIB**—Contains object identifiers (OIDs) for the security branch of the MIBs used in Junos OS for SRX Series devices product, services and traps. This MIB is currently supported only by Junos OS for SRX Series devices. It also explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-smi.txt. For more information, see *Structure of Management Information MIB*.

- **AAA Objects MIB**—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-user-aaa.txt.

For more information, see *AAA Objects MIB*.

- **Access Authentication Objects MIB**—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-auth.txt.

For more information, see *Access Authentication Objects MIB*.

- **Alarm MIB**—Provides support for alarms from the router. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis-alarm.txt.

For more information, see *Alarm MIB*.

- **ATM CoS MIB**—Provides support for monitoring Asynchronous Transfer Mode, version 2 (ATM2) virtual circuit (VC) class-of-service (CoS) configurations. It also provides CoS queue statistics for all VCs that have CoS configured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-atm-cos.txt.

For more information, see *ATM Class-of-Service MIB*.

- **BGP4 V2 MIB**—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-bgpmib2.txt .

For more information, see *BGP4 V2 MIB*.

- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-bfd.txt .

For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis.txt .

For more information, see *Chassis MIBs*.

- Chassis Cluster MIB—Provides information about objects that are used whenever the state of the control link interfaces or fabric link interfaces changes (up to down or down to up) in a chassis cluster deployment. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-jsrpd.txt .

For more information, see *Chassis Cluster MIB* .

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-cfgmgmt.txt .

For more information, see *Configuration Management MIB*.

- Destination Class Usage MIB—Provides support for monitoring packet counts based on the ingress and egress points for traffic transiting your networks. Ingress points are identified by input interface. Egress points are identified by destination prefixes grouped into one or more sets, known as destination classes. One counter is managed per interface per destination class, up to a maximum of 16 counters per interface. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-dcu.txt .

For more information, see *Destination Class Usage MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-dns.txt .

For more information, see *DNS Objects MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inOctets**, **inFrames**, **outOctets**, and **outFrames** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-mac.txt.

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-event.txt.

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-firewall.txt.

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-hostresources.txt.

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-if-extensions.txt.

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipforward.txt.

For more information, see *IP Forward MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt.

For more information, see *IPsec Monitoring MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt.

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipv4.txt.

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-license.txt.

For more information, see *License MIB*.

- Logical Systems MIB—Provides support for logical systems security profile. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt.

For more information, see *Logical Systems MIB*.

- NAT Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-nat.txt.

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-pfe.txt.

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in **pingCtlTable** of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ping.txt.

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-policy.txt.

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-rpf.txt.

NOTE: The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- RMON Events and Alarms MIB—Supports the Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments **alarmTable** with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-rmon.txt.

For more information, see *RMON Events and Alarms MIB*.

- Security Interface Extension Objects MIB—Provides support for the security management of interfaces. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-if-ext.txt.

For more information, see *Security Interface Extension Objects MIB*.

- Security Screening Objects MIB—Defines the MIB for the Juniper Networks Enterprise Firewall screen functionality. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-screening.txt.

For more information, see *Security Screening Objects MIB*.

- Source Class Usage MIB—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-scu.txt.

For more information, see *Source Class Usage MIB*.

- SPU Monitoring MIB—Provides support for monitoring SPUs on SRX5600 and SRX5800 devices. For a downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt.

For more information, see *SPU Monitoring Objects MIB*.

- System Log MIB—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-syslog.txt.

For more information, see *System Log MIB*.

- Traceroute MIB—Supports the Junos OS extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the **traceRouteCtlTable** of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-traceroute.txt.

For more information, see *Traceroute MIB*.

- Utility MIB—Provides SNMP support for exposing Junos OS data and has tables that contain information about each type of data, such as integer and string. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-util.txt.

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported by Junos OS for SRX Series devices only. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-cert.txt.

For more information, see *VPN Certificate Objects MIB*.

For more information, see *Structure of Management Information MIB*.
- AAA Objects MIB—Provides support for monitoring user authentication, authorization, and accounting through the RADIUS, LDAP, SecurID, and local authentication servers. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-user-aaa.txt .
For more information, see *AAA Objects MIB*.
- Access Authentication Objects MIB—Provides support for monitoring firewall authentication, including data about the users trying to access firewall-protected resources and the firewall authentication service itself. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-auth.txt .
For more information, see *Access Authentication Objects MIB*.
- Alarm MIB—Provides support for alarms from the router. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis-alarm.txt .
For more information, see *Alarm MIB*.
- ATM CoS MIB—Provides support for monitoring Asynchronous Transfer Mode, version 2 (ATM2) virtual circuit (VC) class-of-service (CoS) configurations. It also provides CoS queue statistics for all VCs that have CoS configured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-atm-cos.txt .
For more information, see *ATM Class-of-Service MIB*.
- BGP4 V2 MIB—Contains objects used to monitor BGP peer-received prefix counters. It is based upon similar objects in the MIB documented in Internet draft draft-ietf-idr-bgp4-mibv2-03.txt, Definitions of Managed Objects for the Fourth Version of BGP (BGP-4), Second Version. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-bgpmib2.txt .
For more information, see *BGP4 V2 MIB*.
- BFD MIB—Provides support for monitoring Bidirectional Forwarding Detection (BFD) sessions. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-bfd.txt .
For more information, see *Bidirectional Forwarding Detection MIB*.

- Chassis MIB—Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and air flow) and inventory support for the chassis, System Control Board (SCB), System and Switching Board (SSB), Switching and Forwarding Model (SFM), Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-chassis.txt.

For more information, see *Chassis MIBs*.

- Chassis Cluster MIB—Provides information about objects that are used whenever the state of the control link interfaces or fabric link interfaces changes (up to down or down to up) in a chassis cluster deployment. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-jsrpd.txt.

For more information, see *Chassis Cluster MIB*.

- Configuration Management MIB—Provides notification for configuration changes as SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in **jnxCmChgEventTable**. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-cfgmgmt.txt.

For more information, see *Configuration Management MIB*.

- Destination Class Usage MIB—Provides support for monitoring packet counts based on the ingress and egress points for traffic transiting your networks. Ingress points are identified by input interface. Egress points are identified by destination prefixes grouped into one or more sets, known as destination classes. One counter is managed per interface per destination class, up to a maximum of 16 counters per interface. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-dcu.txt.

For more information, see *Destination Class Usage MIB*.

- DNS Objects MIB—Provides support for monitoring DNS proxy queries, requests, responses, and failures. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-dns.txt.

For more information, see *DNS Objects MIB*.

- Ethernet MAC MIB—Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, **inocets**, **inframes**, **outocets**, and **outframes** on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/jnx-mac.txt.

For more information, see *Ethernet MAC MIB*.

- Event MIB—Defines a generic trap that can be generated using an op script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-event.txt.

For more information, see *Event MIB*.

- Firewall MIB—Provides support for monitoring firewall filter counters. Routers must have the Internet Processor II ASIC to perform firewall monitoring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-firewall.txt.

For more information, see *Firewall MIB*.

- Host Resources MIB—Extends the **hrStorageTable** object, providing a measure of the usage of each file system on the router in percentage. Previously, the objects in the **hrStorageTable** measured the usage in allocation units—**hrStorageUsed** and **hrStorageAllocationUnits**—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-hostresources.txt.

For more information, see *Host Resources MIB*.

- Interface MIB—Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-if-extensions.txt.

For more information, see *Interface MIB*.

- IP Forward MIB—Extends the standard IP Forwarding Table MIB (RFC 2096) to include CIDR forwarding information. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipforward.txt.

For more information, see *IP Forward MIB*.

- IPsec Generic Flow Monitoring Object MIB—Based on **jnx-ipsec-monitor-mib**, this MIB provides support for monitoring IPsec and IPsec VPN management objects. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipsec-flow-mon.txt.

For more information, see *IPsec Generic Flow Monitoring Object MIB*.

- IPsec Monitoring MIB—Provides operational and statistical information related to the IPsec and IKE tunnels on Juniper Networks routers. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipsec-monitor-asp.txt.

For more information, see *IPsec Monitoring MIB*.

- IPv4 MIB—Provides additional Internet Protocol version 4 (IPv4) address information, supporting the assignment of identical IPv4 addresses to separate interfaces. For a

downloadable version of this MIB, see

http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ipv4.txt.

For more information, see *IPv4 MIB*.

- License MIB—Extends SNMP support to licensing information, and introduces SNMP traps that alert users when the licenses are about to expire, expire, or when the total number of users exceeds the number specified in the license. For a downloadable version of this MIB, see
http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-license.txt.

For more information, see *License MIB*.

- Logical Systems MIB—Provides support for logical systems security profile. For a downloadable version of this MIB, see
http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-lsys-securityprofile.txt.

For more information, see *Logical Systems MIB*.

- Network Address Translation (NAT) Objects MIB—Provides support for monitoring network address translation (NAT). This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see
http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-nat.txt.

For more information, see *NAT Objects MIB*.

- Packet Forwarding Engine MIB—Provides notification statistics for Packet Forwarding Engines. For a downloadable version of this MIB, see
http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-pfe.txt.

For more information, see *Packet Forwarding Engine MIB*.

- Ping MIB—Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see
http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-ping.txt.

For more information, see *PING MIB*.

- Policy Objects MIB—Provides support for monitoring the security policies that control the flow of traffic from one zone to another. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see
http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-policy.txt.

For more information, see *Policy Objects MIB*.

- Reverse-Path-Forwarding MIB—Monitors statistics for traffic that is rejected because of reverse-path-forwarding (RPF) processing. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-rpf.txt.

NOTE: The enterprise-specific RPF MIB is not supported on EX Series Ethernet Switches.

For more information, see *Reverse Path Forwarding MIB*.

- **RMON Events and Alarms MIB**—Supports the Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments alarmTable with additional information about each alarm. Two new traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-rmon.txt.

For more information, see *RMON Events and Alarms MIB*.

- **Security Interface Extension Objects MIB**—Provides support for the security management of interfaces. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-if-ext.txt.

For more information, see *Security Interface Extension Objects MIB*.

- **Security Screening Objects MIB**—Defines the MIB for the Juniper Networks Enterprise Firewall screen functionality. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-screening.txt.

For more information, see *Security Screening Objects MIB*.

- **Source Class Usage MIB**—Counts packets sent to customers by performing a lookup on the IP source address and the IP destination address. The Source Class Usage (SCU) MIB makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-scu.txt.

For more information, see *Source Class Usage MIB*.

- **SPU Monitoring MIB**—Provides support for monitoring SPUs on SRX5600 and SRX5800 devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-spu-monitoring.txt.

For more information, see *SPU Monitoring Objects MIB*.

- **System Log MIB**—Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-syslog.txt.

For more information, see *System Log MIB*.

- Traceroute MIB—Supports the Junos OS extensions of traceroute and remote operations. Items in this MIB are created when entries are created in the traceRouteCtlTable of the Traceroute MIB. Each item is indexed exactly the same way as it is in the Traceroute MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-traceroute.txt.

For more information, see *Traceroute MIB*.

- Utility MIB—Provides SNMP support for exposing Junos OS data and has tables that contain information on each type of data, such as integer and string. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-util.txt.

For more information, see *Utility MIB*.

- VPN Certificate Objects MIB—Provides support for monitoring the local and CA certificates loaded on the router. This MIB is currently supported only by Junos OS for SRX Series devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos12.1x47/topics/reference/mibs/mib-jnx-js-cert.txt.

For more information, see *VPN Certificate Objects MIB*.

Enterprise-Specific MIBs and Supported Devices

Supported Platforms [EX Series](#), [LN Series](#), [M Series](#), [MX Series](#), [SRX Series](#), [T Series](#)

Table 4 on page 45 lists the enterprise-specific MIBs that are supported on various devices running the Junos OS.

NOTE: In this table, a value of 1 in any of the platform columns (M, MX, T, EX, J, and SRX) denotes that the corresponding MIB is supported on that particular platform. A value of 0 denotes that the MIB is not supported on the platform.

NOTE: This topic uses the following classification for SRX Series devices: Low-End (SRX100, SRX110, SRX210, SRX220, and SRX240), Mid-Range (SRX550 and SRX650), and High-End (SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800).

Table 4: Enterprise-Specific MIBs and Supported Devices

Enterprise-Specific MIB	Platforms							
	M	T	J	MX	EX	SRX

MIB Support Details

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [SRX Series](#), [T Series](#)

[Table 5 on page 54](#) shows enterprise-specific MIB objects supported by Junos OS and provides notes detailing how they are handled when a routing instance is specified in an SNMP request. An en dash (–) indicates that the item is not applicable.

Table 5: MIB Support for Routing Instances (Juniper Networks MIBs)

Object	Support Class	Description/Notes
jnxProducts(1)	–	Product Object IDs
jnxServices(2)	–	Services
jnxMibs(3) jnxBoxAnatomy(1)	Class 3	Objects are exposed only for the default logical system.
mpls(2)	Class 2	All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
ifJnx(3)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxAlarms(4)	Class 3	Objects are exposed only for the default logical system.
jnxFirewalls(5)	Class 4	Data is not segregated by routing instance. All instances are exposed.
jnxDCUs(6)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxPingMIB(7)	Class 3	Objects are exposed only for the default logical system.
jnxTraceRouteMIB(8)	Class 3	Objects are exposed only for the default logical system.
jnxATM(10)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxIpv6(11)	Class 4	Data is not segregated by routing instance. All instances are exposed.

Table 5: MIB Support for Routing Instances (Juniper Networks MIBs) (continued)

Object	Support Class	Description/Notes
jnxIpv4(12)	Class 1	jnxIpv4AddrTable(1) . Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxRmon(13)	Class 3	jnxRmonAlarmTable(1) . Objects are exposed only for the default logical system.
jnxLdp(14)	Class 2	jnxLdpTrapVars(1) . All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
jnxCos(15) jnxCosIfqStatsTable(1) jnxCosFcTable(2) jnxCosFcIdTable(3) jnxCosQstatTable(4)	Class 3	Objects are exposed only for the default logical system.
jnxScu(16) jnxScuStatsTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxRpf(17) jnxRpfStatsTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxCfgMgmt(18)	Class 3	Objects are exposed only for the default logical system.
jnxPMon(19) jnxPMonFlowTable(1) jnxPMonErrorTable(2) jnxPMonMemoryTable(3)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxSonet(20) jnxSonetAlarmTable(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.

Table 5: MIB Support for Routing Instances (Juniper Networks MIBs) (continued)

Object	Support Class	Description/Notes
jnxAtmCos(21) jnxCosAtmVcTable(1) jnxCosAtmScTable(2) jnxCosAtmVcQstatsTable(3) jnxCosAtmTrunkTable(4)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
ipSecFlowMonitorMIB(22)	–	–
jnxMac(23) jnxMacStats(1)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
apsMIB(24)	Class 3	Objects are exposed only for the default logical system.
jnxChassisDefines(25)	Class 3	Objects are exposed only for the default logical system.
jnxVpnMIB(26)	Class 2	All instances within a logical system are exposed. Data will not be segregated down to the routing instance level.
jnxSericesInfoMib(27)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxCollectorMIB(28)	Class 1	Only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.
jnxHistory(29)	–	–
jnxSpMIB(32)	Class 3	Objects are exposed only for the default logical system.

Table 6 on page 57 shows Class 1 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 1 objects, only those logical interfaces (and their parent physical interfaces) that belong to a specific routing instance are exposed.

Table 6: Class 1 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects
Class 1	802.3ad.mib	(dot3adAgg) MIB objects: dot3adAggTable dot3adAggPortListTable (dot3adAggPort) dot3adAggPortTable dot3adAggPortStatsTable dot3adAggPortDebugTable
	rfc2863a.mib	ifTable ifXTable ifStackTable
	rfc2011a.mib	ipAddrTable ipNetToMediaTable
	rtmib.mib	ipForward (ipCidrRouteTable)
	rfc2665a.mib	dot3StatsTable dot3ControlTable dot3PauseTable
	rfc2495a.mib	dsx1ConfigTable dsx1CurrentTable dsx1IntervalTable dsx1TotalTable dsx1FarEndCurrentTable dsx1FarEndIntervalTable dsx1FarEndTotalTable dsx1FracTable ...
	rfc2496a.mib	dsx3 (dsx3ConfigTable)
	rfc2115a.mib	frDlcmiTable (and related MIB objects)
	rfc3592.mib	sonetMediumTable (and related MIB objects)

Table 6: Class 1 MIB Objects (Standard and Juniper MIBs) (*continued*)

Class	MIB	Objects
	rfc3020.mib	mfrMIB mfrBundleTable mfrMibBundleLinkObjects mfrBundleIfIndexMappingTable (and related MIB objects)
	ospf2mib.mib	All objects
	ospf2trap.mib	All objects
	bgpmib.mib	All objects
	rfc2819a.mib	Example: etherStatsTable

Table 6: Class 1 MIB Objects (Standard and Juniper MIBs) (*continued*)

Class	MIB	Objects
Class 1	rfc2863a.mib	Examples: ifXtable ifStackTable
	rfc2665a.mib	etherMIB
	rfc2515a.mib	atmMIB objects Examples: atmInterfaceConfTable atmVplTable atmVclTable
	rfc2465.mib	ip-v6mib Examples: ipv6IfTable ipv6AddrPrefixTable ipv6NetToMediaTable ipv6RouteTable
	rfc2787a.mib	vrrp mib
	rfc2932.mib	ipMRouteMIB ipMRouteStdMIB
	mroutemib.mib	ipMRoute1MIBObjects
	isismib.mib	isisMIB
	pimmib.mib	pimMIB
	msdpmib.mib	msdpmib
	jnx-if-extensions.mib	Examples: ifJnxTable ifChassisTable
	jnx-dcu.mib	jnxDCUs
	jnx-atm.mib	

Table 6: Class 1 MIB Objects (Standard and Juniper MIBs) (*continued*)

Class	MIB	Objects
		Examples: <code>jnxAtmIfTable</code> <code>jnxAtmVcTable</code> <code>jnxAtmVpTable</code>
	<code>jnx-ipv4.mib</code>	<code>jnxipv4</code> Example: <code>jnxIpv4AddrTable</code>
	<code>jnx-cos.mib</code>	Examples: <code>jnxCosIfqStatsTable</code> <code>jnxCosQstatTable</code>
	<code>jnx-scu.mib</code>	Example: <code>jnxScuStatsTable</code>
	<code>jnx-rpf.mib</code>	Example: <code>jnxRpfStatsTable</code>
	<code>jnx-pmon.mib</code>	Example: <code>jnxPMonFlowTable</code>
	<code>jnx-sonet.mib</code>	Example: <code>jnxSonetAlarmTable</code>
	<code>jnx-atm-cos.mib</code>	Examples: <code>jnxCosAtmVcTable</code> <code>jnxCosAtmVcScTable</code> <code>jnxCosAtmVcQstatsTable</code> <code>jnxCosAtmTrunkTable</code>
	<code>jnx-mac.mib</code>	Example: <code>jnxMacStatsTable</code>
	<code>jnx-services.mib</code>	Example: <code>jnxSvcFlowTableAggStatsTable</code>
Class 1	<code>jnx-coll.mib</code>	<code>jnxCollectorMIB</code> Examples: <code>jnxCollPicIfTable</code> <code>jnxCollFileEntry</code>

Table 7 on page 61 shows Class 2 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 2 objects, all instances within a logical system are exposed. Data will not be segregated down to the routing instance level.

Table 7: Class 2 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects
Class 2	rfc3813.mib	mplsLsrStdMIB Examples: mplsInterfaceTable mplsInSegmentTable mplsOutSegmentTable mplsLabelStackTable mplsXCTable (and related MIB objects)
	igmpmib.mib	igmpStdMIB
	l3vpn.mib	mplsVpnMIB
	jnx-mpls.mib	Example: mplsLspList
	jnx-ldp.mib	jnxLdp Example: jnxLdpStatsTable
	jnx-vpn.mib	jnxVpnMIB
	jnx-bgp.mib	jnxBgpM2Experiment

[Table 8 on page 62](#) shows Class 3 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 3, objects are exposed only for the default logical system.

Table 8: Class 3 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects
Class 3	rfc2819a.mib	rmonEvents alarmTable logTable eventTable agentxMIB
	rfc2925a.mib	pingmib
	rfc2925b.mib	tracerouteMIB
	jnxchassis.mib	jnxBoxAnatomy
	jnx-chassis-alarm.mib	jnxAlarms
	jnx-ping.mib	jnxPingMIB
	jnx-traceroute.mib	jnxTraceRouteMIB
	jnx-rmon.mib	jnxRmonAlarmTable
	jnx-cos.mib	Example: jnxCosFcTable
	jnx-cfgmgmt.mib	Example: jnxCfgMgmt
	jnx-sonetaps.mib	apsMIBObjects
	jnx-sp.mib	jnxSpMIB
	ggsn.mib	ejnmobileipABmib
	rfc1907.mib	snmpModules
	snmpModules	Examples: snmpMIB snmpFrameworkMIB

Table 9 on page 63 shows Class 4 MIB objects (standard and enterprise-specific MIBs) supported by Junos OS. With Class 4 objects, data is not segregated by routing instance. All instances are exposed.

Table 9: Class 4 MIB Objects (Standard and Juniper MIBs)

Class	MIB	Objects
Class 4	system	Example: sysORTable
	rfc2011a.mib	ip (ipDefaultTTL, ipInReceives) icmp
	rfc2012a.mib	tcp tcpConnTable ipv6TcpConnTable
	rfc2013a.mib	udp udpTable ipv6UdpTable
	rfc2790a.mib	hrSystem
	rfc2287a.mib	sysAppLOBJ
	jnx-firewall.mib	jnxFirewalls
	jnx-ipv6.mib	jnxIpv6

SNMP MIB Objects Supported by Junos OS for the Set Operation

Supported Platforms [LN Series](#), [SRX Series](#)

The following table lists the SNMP MIB objects that are supported for the **snmp set** operation by Junos OS.

Object Name	Object Identifier
RFC 1907	
sysContact	1.3.6.1.2.1.1.4
sysName	1.3.6.1.2.1.1.5
sysLocation	1.3.6.1.2.1.1.6
snmpEnableAuthenTraps	1.3.6.1.2.1.11.30

Object Name	Object Identifier
RFC 2819a	
alarmInterval	1.3.6.1.2.1.16.3.1.1.2
alarmVariable	1.3.6.1.2.1.16.3.1.1.2
alarmSampleType	1.3.6.1.2.1.16.3.1.1.4
alarmStartupAlarm	1.3.6.1.2.1.16.3.1.1.6
alarmRisingThreshold	1.3.6.1.2.1.16.3.1.1.7
alarmFallingThreshold	1.3.6.1.2.1.16.3.1.1.8
alarmRisingEventIndex	1.3.6.1.2.1.16.3.1.1.9
alarmFallingEventIndex	1.3.6.1.2.1.16.3.1.1.10
alarmOwner	1.3.6.1.2.1.16.3.1.1.11
alarmStatus	1.3.6.1.2.1.16.3.1.1.12
eventDescription	1.3.6.1.2.1.16.9.1.1.2
eventType	1.3.6.1.2.1.16.9.1.1.3
eventCommunity	1.3.6.1.2.1.16.9.1.1.4
eventOwner	1.3.6.1.2.1.16.9.1.1.6
eventStatus	1.3.6.1.2.1.16.9.1.1.7
RFC 2925a	
pingMaxConcurrentRequests	1.3.6.1.2.1.80.1.1
pingCtlTargetAddressType	1.3.6.1.2.1.80.1.2.1.3
pingCtlTargetAddress	1.3.6.1.2.1.80.1.2.1.4
pingCtlDataSize	1.3.6.1.2.1.80.1.2.1.5
pingCtlTimeOut	1.3.6.1.2.1.80.1.2.1.6
pingCtlProbeCount	1.3.6.1.2.1.80.1.2.1.7
pingCtlAdminStatus	1.3.6.1.2.1.80.1.2.1.8

Object Name	Object Identifier
pingCtlDataFill	1.3.6.1.2.1.80.1.2.1.9
pingCtlFrequency	1.3.6.1.2.1.80.1.2.1.10
pingCtlMaxRows	1.3.6.1.2.1.80.1.2.1.11
pingCtlStorageType	1.3.6.1.2.1.80.1.2.1.12
pingCtlTrapGeneration	1.3.6.1.2.1.80.1.2.1.13
pingCtlTrapProbeFailureFilter	1.3.6.1.2.1.80.1.2.1.14
pingCtlTrapTestFailureFilter	1.3.6.1.2.1.80.1.2.1.15
pingCtlType	1.3.6.1.2.1.80.1.2.1.16
pingCtlDescr	1.3.6.1.2.1.80.1.2.1.17
pingCtlSourceAddressType	1.3.6.1.2.1.80.1.2.1.18
pingCtlSourceAddress	1.3.6.1.2.1.80.1.2.1.19
pingCtlIfIndex	1.3.6.1.2.1.80.1.2.1.20
pingCtlByPassRouteTable	1.3.6.1.2.1.80.1.2.1.21
pingCtlDSField	1.3.6.1.2.1.80.1.2.1.22
pingCtlRowStatus	1.3.6.1.2.1.80.1.2.1.23
RFC 2925B	
traceRouteMaxConcurrentRequests	1.3.6.1.2.1.81.1.1
traceRouteCtlTargetAddressType	1.3.6.1.2.1.81.1.2.1.3
traceRouteCtlTargetAddress	1.3.6.1.2.1.81.1.2.1.4
traceRouteCtlByPassRouteTable	1.3.6.1.2.1.81.1.2.1.5
traceRouteCtlDataSize	1.3.6.1.2.1.81.1.2.1.6
traceRouteCtlTimeOut	1.3.6.1.2.1.81.1.2.1.7
traceRouteCtlProbesPerHop	1.3.6.1.2.1.81.1.2.1.8
traceRouteCtlPort	1.3.6.1.2.1.81.1.2.1.9

Object Name	Object Identifier
traceRouteCtlMaxTtl	1.3.6.1.2.1.81.1.2.1.10
traceRouteCtlDSField	1.3.6.1.2.1.81.1.2.1.11
traceRouteCtlSourceAddressType	1.3.6.1.2.1.81.1.2.1.12
traceRouteCtlSourceAddress	1.3.6.1.2.1.81.1.2.1.13
traceRouteCtlIfIndex	1.3.6.1.2.1.81.1.2.1.14
traceRouteCtlMiscOptions	1.3.6.1.2.1.81.1.2.1.15
traceRouteCtlMaxFailure	1.3.6.1.2.1.81.1.2.1.16
traceRouteCtlDontFragment	1.3.6.1.2.1.81.1.2.1.17
traceRouteCtlInitialTtl	1.3.6.1.2.1.81.1.2.1.18
traceRouteCtlFrequency	1.3.6.1.2.1.81.1.2.1.19
traceRouteCtlStorageType	1.3.6.1.2.1.81.1.2.1.20
traceRouteCtlAdminStatus	1.3.6.1.2.1.81.1.2.1.21
traceRouteCtlDescr	1.3.6.1.2.1.81.1.2.1.22
traceRouteCtlMaxRows	1.3.6.1.2.1.81.1.2.1.23
traceRouteCtlTrapGeneration	1.3.6.1.2.1.81.1.2.1.24
traceRouteCtlCreateHopEntries	1.3.6.1.2.1.81.1.2.1.25
traceRouteCtlType	1.3.6.1.2.1.81.1.2.1.26
traceRouteCtlRowStatus	1.3.6.1.2.1.81.1.2.1.27
Enterprise-Specific PING MIB	
jnxPingCtlIfName	1.3.6.1.4.1.2636.3.7.1.2.1.3
jnxPingCtlRoutingIfIndex	1.3.6.1.4.1.2636.3.7.1.2.1.4
jnxPingCtlRoutingIfName	1.3.6.1.4.1.2636.3.7.1.2.1.5
jnxPingCtlRoutingInstanceName	1.3.6.1.4.1.2636.3.7.1.2.1.6
jnxPingCtlRttThreshold	1.3.6.1.4.1.2636.3.7.1.2.1.7

Object Name	Object Identifier

CHAPTER 2

SNMPv3

- [SNMPv3 Overview on page 71](#)

SNMPv3 Overview

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

In contrast to SNMP version 1 (SNMPv1) and SNMP version 2 (SNMPv2), SNMP version 3 (SNMPv3) supports authentication and encryption. SNMPv3 uses the user-based security model (USM) for message security and the view-based access control model (VACM) for access control. USM specifies authentication and encryption. VACM specifies access-control rules.

USM uses the concept of a user for which security parameters (levels of security, authentication, privacy protocols, and keys) are configured for both the agent and the manager. Messages sent using USM are better protected than messages sent with community strings, where passwords are sent in the clear. With USM, messages exchanged between the manager and the agent can have data integrity checking and data origin authentication. USM protects against message delays and message replays by using time indicators and request IDs. Encryption is also available.

To complement the USM, SNMPv3 uses the VACM, a highly granular access-control model for SNMPv3 applications. Based on the concept of applying security policies to the name of the groups querying the agent, the agent decides whether the group is allowed to view or change specific MIB objects. VACM defines collections of data (called views), groups of data users, and access statements that define which views a particular group of users can use for reading, writing, or receiving traps.

Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and contains a single tag. The tag defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target address defines a management application's address and other attributes to be used in sending notifications. Target parameters define the message processing and security parameters to be used in sending notifications to a particular management target.

To configure SNMPv3, perform the following tasks:

Standard SNMP Version 1 Traps

Supported Platforms [LN Series, SRX Series](#)

[Table 10 on page 74](#) provides an overview of the standard traps for SNMPv1. The traps are organized first by trap category and then by trap name, and include their enterprise ID, generic trap number, and specific trap number. The system logging severity levels are listed for those traps that have them with their corresponding system log tag. Traps that do not have corresponding system logging severity levels are marked with an en dash (–) in the table.

For more information about system log messages, see *System Log Monitoring and Troubleshooting Guide for Security Devices*.

Table 10: Standard Supported SNMP Version 1 Traps

Defined in	Trap Name	Enterprise ID	Generic Trap Number	Specific Trap Number	System Logging Severity Level	Syslog Tag	Supported On
Startup Notifications

Table 11: Standard Supported SNMP Version 2 Traps (*continued*)

Defined in	Trap Name	snmpTrapOID	System Logging Severity Level	Syslog Tag	Supported On
RFC 2787, <i>Definitions of Managed Objects for the Virtual Router Redundancy Protocol</i>	vrrpTrapNewMaster	1.3.6.1.2.1.68.0.1	Warning	VRRPD_NEWMASTER_TRAP	All devices running Junos OS.
	vrrpTrapAuthFailure	1.3.6.1.2.1.68.0.2	Warning	VRRPD_AUTH_FAILURE_TRAP	All devices running Junos OS.

The Junos OS also supports the following standard SNMP version 2 traps:

- [SNMP Version 2 MPLS Traps on page 80](#)

SNMP Version 2 MPLS Traps

The Junos OS supports the MPLS SNMP version 2 traps defined in RFC 3812, *Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Management Information Base*.

You can disable the MPLS traps by including the **no-trap** option at the **[edit protocol mpls log-updown]** hierarchy level.

The Junos OS supports the following MPLS traps:

- **mplsTunnelUp**—Generated when an **mplsTunnelOperStatus** object for one of the configured tunnels leaves the **down** state and transitions into another state, other than the **notPresent** state.
- **mplsTunnelDown**—Generated when an **mplsTunnelOperStatus** object for one of the configured tunnels enters the **down** state from a state other than the **notPresent** state.

NOTE: When an LSP flaps, only the ingress and egress routers of that LSP generate the **mplsTunnelUp** and **mplsTunnelDown** traps. Previously, all the routers associated with an LSP—that is, the ingress, egress, and transit routers—used to generate the traps when the LSP flaps.

- **mplsTunnelRerouted**—Generated when a tunnel is rerouted.
- **mplsTunnelReoptimized**—Generated when a tunnel is reoptimized.

NOTE: In Junos OS Release 8.3 and earlier, **mplsTunnelReoptimized** was generated every time the optimization timer expired; that is, when the optimization timer exceeded the value set for the **optimize-timer** statement at the **[edit protocols mpls label-switched-path path-name]** hierarchy level. However, in Release 8.4 and later, this trap is generated only when the path is reoptimized, and not when the optimization timer expires.

Unsupported Standard SNMP Traps

Supported Platforms [LN Series](#), [SRX Series](#)

Standard SNMP traps that are defined in MIBs supported by the Junos OS but are not generated by the Junos OS are shown in [Table 12 on page 82](#).

Table 12: Unsupported Standard SNMP Traps

MIB	Trap Name	Description
isismib.mib	isisDatabaseOverload	Generated when the system enters or leaves the overload state.
	isisManualAddressDrops	Generated when one of the manual areaAddresses assigned to the system is ignored when computing routes.
	isisCorruptedLSPDetected	Generated when an LSP stored in memory becomes corrupted.
	isisAttemptToExceedMaxSequence	Generated when the sequence number on a generated LSP wraps the 32-bit sequence counter and the number is purged.
	isisIDLenMismatch	Generated when a protocol data unit (PDU) is received with a different value for the system ID length. This trap includes an index to identify the circuit where the PDU was received and the PDU header.
	isisMaxAreaAddressesMismatch	Generated when a PDU with a different value for the maximum area addresses is received.
	isisOwnLSPPurge	Generated when a PDU is received with a system ID and zero age. This notification includes the circuit index if available.
	isisSequenceNumberSkip	Generated when an LSP is received with a system ID and different contents, indicating the LSP might require a higher sequence number.
	isisAuthenticationTypeFailure	Generated when a PDU with the wrong authentication type field is received.
	isisAuthenticationFailure	Generated when a PDU with an incorrect authentication information field is received.
	isisVersionSkew	Generated when a hello PDU from an IS running a different version of the protocol is received.
	isisAreaMismatch	Generated when a hello PDU from an IS which does not share any area address is received.
	isisRejectedAdjacency	Generated when a hello PDU from an IS is received, but no adjacency is established because of a lack of resources.
	isisLSPTooLargeToPropagate	Generated when a link-state PDU that is larger than the dataLinkBlockSize for a circuit is attempted, but not propagated.
	isisOriginatingLSPBufferSizeMismatch	

Table 12: Unsupported Standard SNMP Traps (*continued*)

MIB	Trap Name	Description
l3vpn-mib.mib		Generated when a Level 1 link-state PDU or Level 2 link-state PDU is received that is larger than the local value for originating L1LSPBufferSize or originating L2LSPBufferSize , respectively, or when a Level 1 link-state PDU or Level 2 link-state PDU is received containing the originating LSPBufferSize option and the value in the PDU option field does not match the local value for originating L1LSPBufferSize or originating L2LSPBufferSize , respectively.
	isisProtocolsSupportedMismatch	Generated when a nonpseudonode, segment 0 link-state PDU is received that has no matching protocols.
	mplsVrflfUp	Generated when the ifOperStatus of an interface associated with a VRF table changes to the up(1) state, or when an interface with ifOperStatus = up(1) is associated with a VRF table.
	mplsVrflfDown	Generated when the ifOperStatus of an interface associated with a VRF table changes to the down(1) state, or when an interface with ifOperStatus = up(1) state is disassociated from a VRF table.
	mplsNumVrfRouteMidThreshExceeded	Generated when the number of routes contained by the specified VRF table exceeds the value indicated by mplsVrfMidRouteThreshold .
msdpmib.mib	mplsNumVrfRouteMaxThreshExceeded	Generated when the number of routes contained by the specified VRF table reaches or attempts to exceed the maximum allowed value as indicated by mplsVrfMaxRouteThreshold .
	mplsNumVrfSecIllegalLblThrshExcd	Generated when the number of illegal label violations on a VRF table as indicated by mplsVpnVrfSecIllegalLblVltns has exceeded mplsVpnVrfSecIllegalLblRcvThrsh .
	msdpEstablished	Generated when the Multicast Source Discovery Protocol (MSDP) finite state machine (FSM) enters the Established state.
ospf2trap.mib	msdpBackwardTransition	Generated when the MSDP FSM moves from a higher numbered state to a lower numbered state.
	ospfOriginateLsa	Generated when a new LSA is originated by the router because of a topology change.
	ospfLsdbOverflow	Generated when the number of LSAs in the router's link-state database exceeds the value of ospfExtLsdbLimit .
	ospfLsdbApproachingOverflow	Generated when the number of LSAs in the router's link-state database exceeds 90% of the value of ospfExtLsdbLimit .

Table 12: Unsupported Standard SNMP Traps (*continued*)

MIB	Trap Name	Description
rfc1747.mib	sdlcPortStatusChange	Generated when the state of an SDLC port transitions to active or inactive.
	sdlcLSStatusChange	Generated when the state of an SDLC link station transitions to contacted or disconnected.
rfc2115a.mib	frDLCIStatusChange	Generated when a virtual circuit changes state (has been created or invalidated, or has toggled between the active and inactive states).
rfc2662.mib	adslAtucRateChangeTrap	Generated when the ATUCs transmit rate has changed (RADSL mode only).
	adslAtucPerfLofsThreshTrap	Generated when the loss of framing 15-minute interval threshold is reached.
	adslAtucInitFailureTrap	Generated when ATUC initialization fails.
	adslAturPerfLprsThreshTrap	Generated when the loss of power 15-minute interval threshold is reached.
	adslAturRateChangeTrap	Generated when the ATURs transmit rate changes (RADSL mode only).
rfc3020.mib	mfrMibTrapBundleLinkMismatch	Generated when a bundle link mismatch is detected.
rfc3813.mib	mplsXCUp	Generated when mplsXCOperStatus for one or more contiguous entries in mplsXCTable enters the up(1) state from some other state.
	mplsXCDown	Generated when mplsXCOperStatus for one or more contiguous entries in mplsXCTable enters the down(2) state from some other state.

CHAPTER 4

Routing Instances

- [Identifying a Routing Instance on page 85](#)
- [Understanding SNMP Support for Routing Instances on page 86](#)
- [Trap Support for Routing Instances on page 87](#)

Identifying a Routing Instance

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

With this feature, routing instances are identified by either the context field in v3 requests or encoded in the community string in v1 or v2c requests.

When encoded in a community string, the routing instance name appears first and is separated from the actual community string by the @ character.

To avoid conflicts with valid community strings that contain the @ character, the community is parsed only if typical community string processing fails. For example, if a routing instance named **RI** is configured, an SNMP request with **RI@public** is processed within the context of the **RI** routing instance. Access control (views, source address restrictions, access privileges, and so on) is applied according to the actual community string (the set of data after the @ character—in this case **public**). However, if the community string **RI@public** is configured, the protocol data unit (PDU) is processed according to that community and the embedded routing instance name is ignored.

Logical systems perform a subset of the actions of a physical router and have their own unique routing tables, interfaces, policies, and routing instances. When a routing instance is defined within a logical system, the logical system name must be encoded along with the routing instance using a slash (/) to separate the two. For example, if the routing instance **RI** is configured within the logical system **LS**, that routing instance must be encoded within a community string as **LS/RI@public**. When a routing instance is configured outside a logical system (within the default logical system), no logical system name (or / character) is needed.

Also, when a logical system is created, a default routing instance (named **default**) is always created within the logical system. This name should be used when querying data for that routing instance (for example, **LS/default@public**). For v3 requests, the name **logical system/routing instance** should be identified directly in the context field.

NOTE: To identify a virtual LAN (VLAN) spanning-tree instance (VSTP on MX Series 3D Universal Edge Routers), specify the routing instance name followed by a double colon (::) and the VLAN ID. For example, to identify VSTP instance for VLAN 10 in the global default routing instance, include `default::10@public` in the context (SNMPv3) or community (SNMPv1 or v2) string.

Understanding SNMP Support for Routing Instances

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [SRX Series](#), [T Series](#)

Junos OS enables SNMP managers for all routing instances to request and manage SNMP data related to the corresponding routing instances and logical system networks.

In Junos OS:

- Clients from routing instances other than the default can access MIB objects and perform SNMP operations only on the logical system networks to which they belong.
- Clients from the default routing instance can access information related to all routing instances and logical system networks.

Before Junos OS Release 8.4, only the SNMP manager in the default routing instance (`inet.0`) had access to the MIB objects

With the increase in virtual private network (VPN) service offerings, this feature is useful particularly for service providers who need to obtain SNMP data for specific routing instances (see [Figure 1 on page 86](#)). Service providers can use this information for their own management needs or export the data for use by their customers.

Figure 1: SNMP Data for Routing Instances

If no routing instance is specified in the request, the SNMP agent operates as before:

- For nonrouting table objects, all instances are exposed.
- For routing table objects, only those associated with the default routing instance are exposed.

NOTE: The actual protocol data units (PDUs) are still exchanged over the default (inet.0) routing instance, but the data contents returned are dictated by the routing instance specified in the request PDUs.

Trap Support for Routing Instances

Supported Platforms [LN Series, M Series, MX Series, SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, SRX5800, T Series](#)

You can restrict the trap receivers from receiving traps that are not related to the logical system networks to which they belong. To do this, include the **logical-system-trap-filter** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
logical-system-trap-filter;
```

If the **logical-system-trap-filter** statement is not included in the SNMP configuration, all traps are forwarded to the configured routing instance destinations. However, even when this statement is configured, the trap receiver associated with the default routing instance will receive all SNMP traps.

When configured under the trap-group object, all v1 and v2c traps that apply to routing instances (or interfaces belonging to a routing instance) have the routing instance name encoded in the community string. The encoding is identical to that used in request PDUs.

For traps configured under the v3 framework, the routing instance name is carried in the context field when the v3 message processing model has been configured. For other message processing models (v1 or v2c), the routing instance name is not carried in the trap message header (and not encoded in the community string).

CHAPTER 5

Device Management

- [Understanding Device Management Functions in Junos OS on page 89](#)
- [Understanding the Integrated Local Management Interface on page 91](#)

Understanding Device Management Functions in Junos OS

Supported Platforms [LN Series, SRX Series](#)

After you have installed a device into your network, you need to manage the device within your network. Device management can be divided into five tasks:

- Fault management—Monitor the device; detect and fix faults.
- Configuration management—Configure device attributes.
- Accounting management—Collect statistics for accounting purposes.
- Performance management—Monitor and adjust device performance.
- Security management—Control device access and authenticate users.

The Junos OS network management features work in conjunction with an operations support system (OSS) to manage the devices within the network. Junos OS can assist you in performing these management tasks, as described in [Table 13 on page 90](#).

Table 13: Device Management Features in Junos OS

Task	Junos OS Feature
Fault management	Monitor and see faults using: - Operational mode commands—For more information about operational mode commands, see the <i>CLI User Guide</i>. - SNMP MIBs—For more information about SNMP MIBs supported by Junos OS, see “Standard SNMP MIBs Supported by Junos OS” on page 7 and “Juniper Networks Enterprise-Specific MIBs” on page 21. - Standard SNMP traps—For more information about standard SNMP traps, see the “Standard SNMP Traps Supported on Devices Running Junos OS” on page 73. - Enterprise-specific SNMP traps—For more information about enterprise-specific traps, see “Juniper Networks Enterprise-Specific SNMP Traps” on page 73. - System log messages—For more information about how to configure system log messages, see <i>System Log Monitoring and Troubleshooting Guide for Security Devices</i>.
Configuration management	- Configure device attributes using the command-line interface (CLI). For more information about configuring the device using the CLI, see the <i>CLI User Guide</i>. - Configuration Management MIB—For more information about the Configuration Management MIB, see the <i>Configuration Management MIB</i>.
Accounting management	Perform the following accounting-related tasks: - Collect statistics for interfaces, firewall filters, destination classes, source classes, and the Routing Engine. For more information about collecting statistics, see <i>Accounting Options Configuration</i>. - Use interface-specific traffic statistics and other counters, available in the Standard Interfaces MIB, Juniper Networks enterprise-specific extensions to the Interfaces MIB, and media-specific MIBs, such as the enterprise-specific ATM MIB. - Count packets as part of a firewall filter. For more information about firewall filter policies, see “Juniper Networks Enterprise-Specific MIBs” on page 21 and the <i>Junos OS Routing Protocols Library for Security Devices</i>.
Performance management	Monitor performance in the following ways: - Use operational mode commands. For more information about monitoring performance using operational mode commands, see the <i>CLI User Guide</i>. - Use firewall filters. For more information about performance monitoring using firewall filters, see the <i>Junos OS Routing Protocols Library for Security Devices</i>.

Table 13: Device Management Features in Junos OS (*continued*)

Task	Junos OS Feature
Security management	Assure security in your network in the following ways: - Control access to the router and authenticate users. For more information about access control and user authentication, see the <i>Junos OS User Authentication Library for Security Devices</i>. - Control access to the router using SNMPv3 and SNMP over IPv6. For more information, see “Configuring the Local Engine ID” on page 120 and “Tracing SNMP Activity on a Device Running Junos OS” on page 297.

Understanding the Integrated Local Management Interface

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

The Integrated Local Management Interface (ILMI) provides a mechanism for Asynchronous Transfer Mode (ATM)-attached devices, such as hosts, routers, and ATM switches, to transfer management information. ILMI provides bidirectional exchange of management information between two ATM interfaces across a physical connection. ILMI information is exchanged over a direct encapsulation of SNMP version 1 (RFC 1157, *A Simple Network Management Protocol*) over ATM Adaptation Layer 5 (AAL5) using a virtual path identifier/virtual channel identifier (VPI/VCI) value (VPI=0, VCI=16).

Junos OS supports only two ILMI MIB variables: **atmfMYIPNmAddress** and **atmfPortMyIfname**. For ATM1 and ATM2 intelligent queuing (IQ) interfaces, you can configure ILMI to communicate directly with an attached ATM switch to enable querying of the switch's IP address and port number.

For more information about the ILMI MIB, see the ATM Forum at <http://www.atmforum.com/>.

- [Understanding Device Management Functions in Junos OS on page 89](#)

CHAPTER 6

Remote Operations

- [SNMP Remote Operations Overview on page 93](#)

SNMP Remote Operations Overview

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

A SNMP remote operation is any process on the router that can be controlled remotely using SNMP. Junos OS currently provides support for two SNMP remote operations: the Ping MIB and Traceroute MIB, defined in RFC 2925. Using these MIBs, an SNMP client in the network management system (NMS) can:

- Start a series of operations on a router
- Receive notification when the operations are complete
- Gather the results of each operation

Junos OS also provides extended functionality to these MIBs in the Juniper Networks enterprise-specific extensions **jnxPingMIB** and **jnxTraceRouteMIB**. For more information about **jnxPingMIB** and **jnxTraceRouteMIB**, see *PING MIB* and *Traceroute MIB*.

This topic covers the following sections:

- [SNMP Remote Operation Requirements on page 93](#)
- [Setting SNMP Views on page 93](#)
- [Setting Trap Notification for Remote Operations on page 94](#)
- [Using Variable-Length String Indexes on page 95](#)
- [Enabling Logging on page 95](#)

SNMP Remote Operation Requirements

To use SNMP remote operations, you should be experienced with SNMP conventions. You must also configure Junos OS to allow the use of the remote operation MIBs.

Setting SNMP Views

All remote operation MIBs supported by Junos OS require that the SNMP clients have read-write privileges. The default SNMP configuration of Junos OS does not provide clients with a community string with such privileges.

To set read-write privileges for an SNMP community string, include the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community community-name {
  authorization authorization;
  view view-name;
}
view view-name {
  oid object-identifier (include | exclude);
}
```

Example: Setting SNMP Views

To create a community named **remote-community** that grants SNMP clients read-write access to the Ping MIB, **jnxPing** MIB, Traceroute MIB, and **jnxTraceRoute** MIB, include the following statements at the **[edit snmp]** hierarchy level:

```
snmp {
  view remote-view {
    oid 1.3.6.1.2.1.80 include; # pingMIB
    oid 1.3.6.1.4.1.2636.3.7 include; # jnxPingMIB
    oid 1.3.6.1.2.1.81 include; # traceRouteMIB
    oid 1.3.6.1.4.1.2636.3.8 include; # jnxTraceRouteMIB
  }
  community remote-community {
    view remote-view;
    authorization read-write;
  }
}
```

For more information about the **community** statement, see [“Configuring the SNMP Community String” on page 165](#) and [community](#).

For more information about the **view** statement, see [“Configuring MIB Views” on page 118](#), [view \(Associating a MIB View with a Community\)](#), and [view \(Configuring a MIB View\)](#).

Setting Trap Notification for Remote Operations

In addition to configuring the remote operations MIB for trap notification, you must also configure Junos OS. You must specify a target host for remote operations traps.

To configure trap notification for SNMP remote operations, include the **categories** and **targets** statements at the **[edit snmp trap-group group-name]** hierarchy level:

```
[edit snmp trap-group group-name]
categories {
  category;
}
targets {
  address;
}
}
```

Example: Setting Trap Notification for Remote Operations

Specify 172.17.12.213 as a target host for all remote operation traps:

```
snmp {
  trap-group remote-traps {
    categories remote-operations;
    targets {
      172.17.12.213;
    }
  }
}
```

For more information about trap groups, see [“Configuring SNMP Trap Groups” on page 141](#).

Using Variable-Length String Indexes

All tabular objects in the remote operations MIBs supported by Junos OS are indexed by two variables of type **SnmpAdminString**. For more information about **SnmpAdminString**, see RFC 2571.

Junos OS does not handle **SnmpAdminString** any differently from the octet string variable type. However, the indexes are defined as variable length. When a variable length string is used as an index, the length of the string must be included as part of the object identifier (OID).

Example: Set Variable-Length String Indexes

To reference the **pingCtlTargetAddress** variable of a row in **pingCtlTable** where **pingCtlOwnerIndex** is **bob** and **pingCtlTestName** is **test**, use the following object identifier (OID):

```
pingMIB.pingObjects.pingCtlTable.pingCtlEntry.pingCtlTargetAddress."bob"."test"
1.3.6.1.2.1.80.1.2.1.4.3.98.111.98.4.116.101.115.116
```

For more information about the definition of the Ping MIB, see RFC 2925.

Enabling Logging

The SNMP error code returned in response to SNMP requests can only provide a generic description of the problem. The error descriptions logged by the remote operations process can often provide more detailed information about the problem and help you to solve the problem faster. This logging is not enabled by default. To enable logging, include the **flag general** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit]
snmp {
  traceoptions {
    flag general;
  }
}
```

For more information about traceoptions, see [“Tracing SNMP Activity on a Device Running Junos OS” on page 297](#).

If the remote operations process receives an SNMP request that it cannot accommodate, the error is logged in the `/var/log/rmopd` file. To monitor this log file, issue the **monitor start rmopd** command in operational mode of the command-line interface (CLI).

Remote Monitoring, Health Monitoring, and Service Quality

- [Understanding RMON Alarms on page 97](#)
- [Understanding RMON Events on page 99](#)
- [Understanding Measurement Points, Key Performance Indicators, and Baseline Values on page 100](#)
- [Understanding RMON for Monitoring Service Quality on page 101](#)

Understanding RMON Alarms

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

An RMON alarm identifies:

- A specific MIB object that is monitored.
- The frequency of sampling.
- The method of sampling.
- The thresholds against which the monitored values are compared.

An RMON alarm can also identify a specific **eventTable** entry to be triggered when a threshold is crossed.

Configuration and operational values are defined in **alarmTable** in RFC 2819. Additional operational values are defined in Juniper Networks enterprise-specific extensions to **alarmTable** (**jnxRmonAlarmTable**).

This topic covers the following sections:

- [alarmTable on page 98](#)
- [jnxRmonAlarmTable on page 98](#)

alarmTable

alarmTable in the RMON MIB allows you to monitor and poll the following:

- **alarmIndex**—The index value for **alarmTable** that identifies a specific entry.
- **alarmInterval**—The interval, in seconds, over which data is sampled and compared with the rising and falling thresholds.
- **alarmVariable**—The MIB variable that is monitored by the alarm entry.
- **alarmSampleType**—The method of sampling the selected variable and calculating the value to be compared against the thresholds.
- **alarmValue**—The value of the variable during the last sampling period. This value is compared with the rising and falling thresholds.
- **alarmStartupAlarm**—The alarm sent when the entry is first activated.
- **alarmRisingThreshold**—The upper threshold for the sampled variable.
- **alarmFallingThreshold**—The lower threshold for the sampled variable.
- **alarmRisingEventIndex**—The **eventTable** entry used when a rising threshold is crossed.
- **alarmFallingEventIndex**—The **eventTable** entry used when a falling threshold is crossed.
- **alarmStatus**—Method for adding and removing entries from the table. It can also be used to change the state of an entry to allow modifications.

NOTE: If this object is not set to valid, the associated event alarm does not take any action.

jnxRmonAlarmTable

The **jnxRmonAlarmTable** is a Juniper Networks enterprise-specific extension to **alarmTable**. It provides additional operational information and includes the following objects:

- **jnxRmonAlarmGetFailCnt**—The number of times the internal **Get** request for the variable monitored by this entry has failed.
- **jnxRmonAlarmGetFailTime**—The value of **sysUpTime** when an internal **Get** request for the variable monitored by this entry last failed.
- **jnxRmonAlarmGetFailReason**—The reason an internal **Get** request for the variable monitored by this entry last failed.
- **jnxRmonAlarmGetOkTime**—The value of **sysUpTime** when an internal **Get** request for the variable monitored by this entry succeeded and the entry left the **getFailure** state.
- **jnxRmonAlarmState**—The current state of this RMON alarm entry.

To view the Juniper Networks enterprise-specific extensions to the RMON Events and Alarms and Event MIB, see http://www.juniper.net/techpubs/en_US/junos10.3/topics/reference/mibs/mib-jnx-rmon.txt.

For more information about the Juniper Networks enterprise-specific extensions to the RMON Events and Alarms MIB, see “*RMON Events and Alarms MIB*” in the *SNMP MIBs and Traps Monitoring and Troubleshooting Guide for Security Devices*.

Understanding RMON Events

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

An RMON event allows you to log the crossing of thresholds of other MIB objects. It is defined in **eventTable** for the RMON MIB.

This section covers the following topics:

- [eventTable on page 99](#)

eventTable

eventTable contains the following objects:

- **eventIndex**—An index that uniquely identifies an entry in **eventTable**. Each entry defines one event that is generated when the appropriate conditions occur.
- **eventDescription**—A comment describing the event entry.
- **eventType**—Type of notification that the probe makes about this event.
- **eventCommunity**—Trap group used if an SNMP trap is to be sent. If **eventCommunity** is not configured, a trap is sent to each trap group configured with the **rmon-alarm** category.
- **eventLastTimeSent**—Value of **sysUpTime** when this event entry last generated an event.
- **eventOwner**—Any text string specified by the creating management application or the command-line interface (CLI). Typically, it is used to identify a network manager (or application) and can be used for fine access control between participating management applications.
- **eventStatus**—Status of this event entry.

NOTE: If this object is not set to valid, no action is taken by the associated event entry. When this object is set to valid, all previous log entries associated with this entry (if any) are deleted.

Understanding Measurement Points, Key Performance Indicators, and Baseline Values

Supported Platforms LN Series, M Series, MX Series, PTX Series, T Series

This chapter topic provides guidelines for monitoring the service quality of an IP network. It describes how service providers and network administrators can use information provided by Juniper Networks routers to monitor network performance and capacity. You should have a thorough understanding of the SNMP and the associated MIB supported by Junos OS.

NOTE: For a good introduction to the process of monitoring an IP network, see RFC 2330, *Framework for IP Performance Metrics*.

This topic contains the following sections:

- [Measurement Points on page 100](#)
- [Basic Key Performance Indicators on page 101](#)
- [Setting Baselines on page 101](#)

Measurement Points

Defining the measurement points where metrics are measured is equally as important as defining the metrics themselves. This section describes measurement points within the context of this chapter and helps identify where measurements can be taken from a service provider network. It is important to understand exactly where a measurement point is. Measurement points are vital to understanding the implication of what the actual measurement means.

An IP network consists of a collection of routers connected by physical links that are all running the Internet Protocol. You can view the network as a collection of routers with an ingress (entry) point and an egress (exit) point. See [Figure 2 on page 100](#).

- Network-centric measurements are taken at measurement points that most closely map to the ingress and egress points for the network itself. For example, to measure delay across the provider network from Site A to Site B, the measurement points should be the ingress point to the provider network at Site A and the egress point at Site B.
- Router-centric measurements are taken directly from the routers themselves, but be careful to ensure that the correct router subcomponents have been identified in advance.

Figure 2: Network Entry Points

g017042

NOTE: [Figure 2 on page 100](#) does not show the client networks at customer premises, but they would be located on either side of the ingress and egress points. Although this chapter does not discuss how to measure network services as perceived by these client networks, you can use measurements taken for the service provider network as input into such calculations.

Basic Key Performance Indicators

For example, you could monitor a service provider network for three basic key performance indicators (KPIs):

- *Availability* measures the “reachability” of one measurement point from another measurement point at the network layer (for example, using ICMP ping). The underlying routing and transport infrastructure of the provider network will support the availability measurements, with failures highlighted as unavailability.
- *Health* measures the number and type of errors that are occurring on the provider network, and can consist of both router-centric and network-centric measurements, such as hardware failures or packet loss.
- *Performance* of the provider network measures how well it can support IP services (for example, in terms of delay or utilization).

Setting Baselines

How well is the provider network performing? We recommend an initial three-month period of monitoring to identify a network’s normal operational parameters. With this information, you can recognize exceptions and identify abnormal behavior. You should continue baseline monitoring for the lifetime of each measured metric. Over time, you must be able to recognize performance trends and growth patterns.

Within the context of this chapter, many of the metrics identified do not have an allowable operational range associated with them. In most cases, you cannot identify the allowable operational range until you have determined a baseline for the actual variable on a specific network.

Related Documentation

- [Understanding RMON for Monitoring Service Quality on page 101](#)

Understanding RMON for Monitoring Service Quality

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

Health and performance monitoring can benefit from the remote monitoring of SNMP variables by the local SNMP agents running on each router. The SNMP agents compare MIB values against predefined thresholds and generate exception alarms without the need for polling by a central SNMP management platform. This is an effective mechanism for proactive management, as long as the thresholds have baselines determined and set correctly. For more information, see RFC 2819, *Remote Network Monitoring MIB*.

This topic includes the following sections:

- [Setting Thresholds on page 102](#)
- [RMON Command-Line Interface on page 103](#)
- [RMON Event Table on page 103](#)
- [RMON Alarm Table on page 104](#)
- [Troubleshooting RMON on page 104](#)

Setting Thresholds

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside of the allowable operational range. (See [Figure 3 on page 102](#).)

Figure 3: Setting Thresholds

Events are only generated when the threshold is first crossed in any one direction rather than after each sample period. For example, if a rising threshold crossing event is raised, no more threshold crossing events will occur until a corresponding falling event. This considerably reduces the quantity of alarms that are produced by the system, making it easier for operations staff to react when alarms do occur.

To configure remote monitoring, specify the following pieces of information:

- The variable to be monitored (by its SNMP object identifier)
- The length of time between each inspection
- A rising threshold
- A falling threshold
- A rising event
- A falling event

Before you can successfully configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline

period of at least three months is not unusual when first identifying the operational ranges and defining thresholds, but baseline monitoring should continue over the life span of each monitored variable.

RMON Command-Line Interface

Junos OS provides two mechanisms you use to control the Remote Monitoring agent on the router: command-line interface (CLI) and SNMP. To configure an RMON entry using the CLI, include the following statements at the **[edit snmp]** hierarchy level:

```
rmon {
  alarm index {
    description;
    falling-event-index;
    falling-threshold;
    intervals;
    rising-event-index;
    rising-threshold;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling | rising | rising-or-falling);
    variable;
  }
  event index {
    community;
    description;
    type (log | trap | log-and-trap | none);
  }
}
```

If you do not have CLI access, you can configure remote monitoring using the SNMP Manager or management application, assuming SNMP access has been granted. (See [Table 14 on page 103](#).) To configure RMON using SNMP, perform SNMP **Set** requests to the RMON event and alarm tables.

RMON Event Table

Set up an event for each type that you want to generate. For example, you could have two generic events, *rising* and *falling*, or many different events for each variable that is being monitored (for example, *temperature rising* event, *temperature falling* event, *firewall hit* event, *interface utilization* event, and so on). Once the events have been configured, you do not need to update them.

Table 14: RMON Event Table

Field	Description
eventDescription	Text description of this event
eventType	Type of event (for example, log , trap , or log and trap)
eventCommunity	Trap group to which to send this event (as defined in the Junos OS configuration, which is not the same as the community)
eventOwner	Entity (for example, manager) that created this event

Table 14: RMON Event Table (*continued*)

Field	Description
eventStatus	Status of this row (for example, valid , invalid , or createRequest)

RMON Alarm Table

The RMON alarm table stores the SNMP object identifiers (including their instances) of the variables that are being monitored, together with any rising and falling thresholds and their corresponding event indexes. To create an RMON request, specify the fields shown in [Table 15 on page 104](#).

Table 15: RMON Alarm Table

Field	Description
alarmStatus	Status of this row (for example, valid , invalid , or createRequest)
alarmInterval	Sampling period (in seconds) of the monitored variable
alarmVariable	OID (and instance) of the variable to be monitored
alarmValue	Actual value of the sampled variable
alarmSampleType	Sample type (absolute or delta changes)
alarmStartupAlarm	Initial alarm (rising , falling , or either)
alarmRisingThreshold	Rising threshold against which to compare the value
alarmFallingThreshold	Falling threshold against which to compare the value
alarmRisingEventIndex	Index (row) of the rising event in the event table
alarmFallingEventIndex	Index (row) of the falling event in the event table

Both the **alarmStatus** and **eventStatus** fields are **entryStatus** primitives, as defined in RFC 2579, *Textual Conventions for SMIV2*.

Troubleshooting RMON

You troubleshoot the RMON agent, **rmopd**, that runs on the router by inspecting the contents of the Juniper Networks enterprise RMON MIB, **jnxRmon**, which provides the extensions listed in [Table 16 on page 104](#) to the RFC 2819 **alarmTable**.

Table 16: jnxRmon Alarm Extensions

Field	Description
jnxRmonAlarmGetFailCnt	Number of times the internal Get request for the variable failed

Table 16: jnxRmon Alarm Extensions (*continued*)

Field	Description
<code>jnxRmonAlarmGetFailTime</code>	Value of <code>sysUpTime</code> when the last failure occurred
<code>jnxRmonAlarmGetFailReason</code>	Reason why the <code>Get</code> request failed
<code>jnxRmonAlarmGetOkTime</code>	Value of <code>sysUpTime</code> when the variable moved out of failure state
<code>jnxRmonAlarmState</code>	Status of this alarm entry

Monitoring the extensions in this table provides clues as to why remote alarms may not behave as expected.

Configuring SNMP on a Device Running Junos OS

Supported Platforms [LN Series, M Series, MX Series, PTX Series, SRX Series, T Series](#)

By default, SNMP is disabled on devices running Junos OS. To enable SNMP on a router or switch, you must include the SNMP configuration statements at the **[edit snmp]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit snmp]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

The community defined here as **public** grants read access to all MIB data to any client.

To configure complete SNMP features, include the following statements at the **[edit snmp]** hierarchy level:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
    routing-instance routing-instance-name {
      clients {
        addresses;
      }
    }
    logical-system logical-system-name {
      routing-instance routing-instance-name {
        clients {
          addresses;
        }
      }
    }
  }
  view view-name;
}

Configuring the System Contact on a Device Running Junos OS

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

You can specify an administrative contact for each system being managed by SNMP. This name is placed into the MIB II **sysContact** object. To configure a contact name, include the **contact** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
contact contact;
```

If the name contains spaces, enclose it in quotation marks (" ").

To define a system contact name that contains spaces:

```
[edit]
snmp {
  contact "Juniper Berry, (650) 555-1234";
}
```

Configuring the System Description on a Device Running Junos OS

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

You can specify a description for each system being managed by SNMP. This string is placed into the MIB II **sysDescription** object. To configure a description, include the **description** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
description description;
```

If the description contains spaces, enclose it in quotation marks (" ").

To specify the system description:

```
[edit]
snmp {
  description "M40 router with 8 FPCs";
}
```

Configuring the Commit Delay Timer

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

When a router or switch first receives an SNMP nonvolatile **Set** request, a Junos OS XML protocol session opens and prevents other users or applications from changing the candidate configuration (equivalent to the command-line interface [CLI] **configure exclusive** command). If the router does not receive new SNMP **Set** requests within 5 seconds (the default value), the candidate configuration is committed and the Junos OS XML protocol session closes (the configuration lock is released). If the router receives new SNMP **Set** requests while the candidate configuration is being committed, the SNMP **Set** request is rejected and an error is generated. If the router receives new SNMP **Set** requests before 5 seconds have elapsed, the commit-delay timer (the length of time between when the last SNMP request is received and the commit is requested) resets to 5 seconds.

By default, the timer is set to 5 seconds. To configure the timer for the SNMP **Set** reply and start of the commit, include the **commit-delay** statement at the **[edit snmp nonvolatile]** hierarchy level:

```
[edit snmp nonvolatile]
  commit-delay seconds;
```

seconds is the length of the time between when the SNMP request is received and the commit is requested for the candidate configuration. For more information about the **configure exclusive** command and locking the configuration, see the *CLI User Guide*.

Loading MIB Files to a Network Management System

Supported Platforms [LN Series](#), [SRX Series](#)

For your network management system (NMS) to identify and understand the MIB objects used by the Junos OS, you must first load the MIB files to your NMS using a MIB compiler. A MIB compiler is a utility that parses the MIB information such as the MIB object name, IDs, and data type for the NMS.

You can download the Junos MIB package from the **Enterprise-Specific MIBs and Traps** section of the Junos OS Technical Publications index page at <http://www.juniper.net/techpubs/software/junos/index.html>. The Junos MIB package is available in **.zip** and **.tar** packages. You can download the appropriate format based on your requirements.

The Junos MIB package contains two folders: **StandardMibs** and **JuniperMibs**. The **StandardMibs** folder contains the standard MIBs and RFCs that are supported on devices running the Junos OS, whereas the **JuniperMibs** folder contains the Juniper Networks enterprise-specific MIBs.

To load MIB files that are required for managing and monitoring devices running the Junos OS:

1. Go to the Junos OS Technical Publications index page (<http://www.juniper.net/techpubs/software/junos/index.html>).
2. Click the tab that corresponds to the Junos OS Release for which you want to download the MIB files.
3. On the selected tab, click the + (plus) sign that corresponds to the **Enterprise-Specific MIBs and Traps** section to expand the section.
4. Click the **TAR** or **ZIP** link that corresponds to the **Enterprise MIBs** link under the **Enterprise-Specific MIBs and Traps** section to download the Junos MIB package.
5. Decompress the file (.tar or .zip) using an appropriate utility.
6. Load the standard MIB files (from the **StandardMibs** folder) in the following order:

NOTE: Some of the MIB compilers that are commonly used have the standard MIBs preloaded on them. If the standard MIBs are already loaded on the MIB compiler that you are using, skip this step and proceed to Step 7.

- a. mib-SNMPv2-SMI.txt
 - b. mib-SNMPv2-TC.txt
 - c. mib-IANAifType-MIB.txt
 - d. mib-IANA-RTPROTO-MIB.txt
 - e. mib-rfc1907.txt
 - f. mib-rfc2011a.txt
 - g. mib-rfc2012a.txt
 - h. mib-rfc2013a.txt
 - i. mib-rfc2863a.txt
7. Load the remaining standard MIB files.

NOTE: You must follow the order specified in this procedure, and ensure that all standard MIBs are loaded before you load the enterprise-specific MIBs. There might be dependencies that require a particular MIB to be present on the compiler before loading some other MIB. You can find such dependencies listed in the **IMPORT** section of the MIB file.

8. Load the Juniper Networks enterprise-specific SMI MIB, **mib-jnx-smi.txt**, and the following optional SMI MIBs based on your requirements:
 - **mib-jnx-js-smi.txt**—(Optional) For Juniper Security MIB tree objects
 - **mib-jnx-ex-smi.txt**—(Optional) For EX Series Ethernet Switches
 - **mib-jnx-exp.txt**—(Recommended) For Juniper Networks experimental MIB objects
9. Load the remaining enterprise-specific MIBs from the **JuniperMibs** folder.

TIP: While loading a MIB file, if the compiler returns an error message saying that any of the objects is undefined, open the MIB file using a text editor and ensure that all the MIB files listed in the **IMPORT** section are loaded on the compiler. If any of the MIB files listed in the **IMPORT** section is not loaded on the compiler, load that MIB file, and then try to load the MIB file that failed to load.

For example, the enterprise-specific PING MIB, **mib-jnx-ping.txt**, has dependencies on RFC 2925, DiSMAN-PING-MIB, **mib-rfc2925a.txt**. If you try to load **mib-jnx-ping.txt** before loading **mib-rfc2925a.txt**, the compiler returns an error message saying that certain objects in **mib-jnx-ping.txt** are undefined. Load **mib-rfc2925a.txt**, and then try to load **mib-jnx-ping.txt**. The enterprise-specific PING MIB, **mib-jnx-ping.txt**, then loads without any issue.

Filtering Duplicate SNMP Requests

Supported Platforms [LN Series](#), [PTX Series](#), [SRX Series](#)

By default, filtering duplicate **get**, **getNext**, and **getBulk** SNMP requests is disabled on devices running Junos OS. If a network management station retransmits a **Get**, **GetNext**, or **GetBulk** SNMP request too frequently to the router, that request might interfere with the processing of previous requests and slow down the response time of the agent. Filtering these duplicate requests improves the response time of the SNMP agent. Junos OS uses the following information to determine if an SNMP request is a duplicate:

- Source IP address of the SNMP request
- Source UDP port of the SNMP request
- Request ID of the SNMP request

To filter duplicate SNMP requests, include the **filter-duplicates** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]  
filter-duplicates;
```

- Related Documentation**

Configuring the Interfaces on Which SNMP Requests Can Be Accepted

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [SRX Series](#), [T Series](#)

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

- Related Documentation**
- [Configuring SNMP on a Device Running Junos OS on page 109](#)
 - [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 192](#)
 - [Example: Configuring Secured Access List Checking on page 117](#)

Example: Configuring Secured Access List Checking

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Grant SNMP access privileges only to devices on interfaces **so-0/0/0** and **at-1/0/1**. The following example does this by configuring a list of logical interfaces:

```
[edit]
snmp {
  interface [ so-0/0/0 so-0/0/0.1 at-1/0/1.0 at-1/0/1.1 ];
}
```

The following example grants the same access by configuring a list of physical interfaces:

```
[edit]
snmp {
  interface [ so-0/0/0 at-1/0/1 ];
}
```

- Related Documentation**
- [Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 117](#)
 - [Filtering Interface Information Out of SNMP Get and GetNext Output on page 118](#)
 - [Configuring SNMP on a Device Running Junos OS on page 109](#)
 - [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 192](#)

Filtering Interface Information Out of SNMP Get and GetNext Output

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Junos OS enables you to filter out information related to specific interfaces from the output of SNMP **Get** and **GetNext** requests performed on interface-related MIBs such as IF MIB, ATM MIB, RMON MIB, and the Juniper Networks enterprise-specific IF MIB.

You can use the following options of the **filter-interfaces** statement at the **[edit snmp]** hierarchy level to specify the interfaces that you want to exclude from SNMP **Get** and **GetNext** queries:

- **interfaces**—Interfaces that match the specified regular expressions.
- **all-internal-interfaces**—Internal interfaces.

```
[edit]
snmp {
  filter-interfaces {
    interfaces {
      interface1;
      interface2;
    }
    all-internal-interfaces;
  }
}
```

However, note that these settings are limited to SNMP operations, and the users can continue to access information related to the interfaces (including those hidden using the **filter-interfaces** options) using the appropriate Junos OS command-line interface (CLI) commands.

- Related Documentation**
- [Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 117](#)

 - [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 192](#)

Configuring MIB Views

Supported Platforms [LN Series](#), [QFX Series](#), [SRX Series](#)

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To configure MIB views, include the **view** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
```

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

NOTE: To remove an OID completely, use the **delete view all oid *oid-number*** command but omit the **include** parameter.

To associate MIB views with a community, include the **view** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]  
view view-name;
```

For more information about the Ping MIB, see RFC 2925 and the *PING MIB* topic.

Related Documentation

- [Configuring SNMP on a Device Running Junos OS on page 109](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 192](#)
- [Example: Ping Proxy MIB on page 119](#)
- [view \(Configuring a MIB View\) on page 284](#)
- [oid on page 234](#)

Example: Ping Proxy MIB

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Restrict the **ping-mib** community to read and write access of the Ping MIB and **jnxpingMIB** only. Read or write access to any other MIB using this community is not allowed.

```
[edit snmp]  
view ping-mib-view {  
    oid 1.3.6.1.2.1.80 include; #pingMIB  
    oid jnxPingMIB include; #jnxPingMIB  
}  
community ping-mib {  
    authorization read-write;  
    view ping-mib-view;  
}
```

The following configuration prevents the **no-ping-mib** community from accessing Ping MIB and **jnxPingMIB** objects. However, this configuration does not prevent the **no-ping-mib** community from accessing any other MIB object that is supported on the device.

```
[edit snmp]  
view no-ping-mib-view {  
    oid 1.3.6.1.2.1.80 exclude; # deny access to pingMIB objects
```

```
oid jnxPingMIB exclude; # deny access to jnxPingMIB objects
}
community no-ping-mib {
  authorization read-write;
  view ping-mib-view;
}
```

Configuring the Local Engine ID

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

By default, the local engine ID uses the default IP address of the router. The local engine ID is the administratively unique identifier for the SNMPv3 engine. This statement is optional. To configure the local engine ID, include the **engine-id** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
engine-id {
  (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

- **local engine-id-suffix**—The engine ID suffix is explicitly configured.
- **use-default-ip-address**—The engine ID suffix is generated from the default IP address.
- **use-mac-address**—The SNMP engine identifier is generated from the Media Access Control (MAC) address of the management interface on the router.

The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*. You can configure the suffix here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID. For the engine ID, we recommend using the master IP address of the device if the device has multiple routing engines and has the master IP address configured. Alternatively, you can use the MAC address of the management port if the device has only one Routing Engine.

Configuring SNMP Informs

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [SRX Series](#), [T Series](#)

Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see [Figure 4 on page 121](#)). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

Figure 4: Inform Request and Response

- [Assigning Security Model and Security Name to a Group on page 132](#)
- [Example: Security Group Configuration on page 133](#)
- [Example: Configuring the Tag List on page 134](#)
- [Example: Creating SNMPv3 Users Configuration on page 135](#)

Creating SNMPv3 Users

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [SRX Series](#), [T Series](#)

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

NOTE: You can configure only one encryption type for each SNMPv3 user.

To create users, include the **user** statement at the **[edit snmp v3 usm local-engine]** hierarchy level:

```
[edit snmp v3 usm local-engine]
user username;
```

username is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the **[edit snmp v3 usm local-engine user username]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}
```

```
authentication-sha {  
    authentication-password authentication-password;  
}  
authentication-none;  
privacy-aes128 {  
    privacy-password privacy-password;  
}  
privacy-des {  
    privacy-password privacy-password;  
}  
privacy-3des {  
    privacy-password privacy-password;  
}  
privacy-none;
```

Example: SNMPv3 Configuration

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Define an SNMPv3 configuration:

```
[edit snmp]  
engine-id {  
    use-mac-address;  
}  
view jnxAlarms {  
    oid 1.3.6.1.4.1.2636.3.4 include;  
}  
view interfaces {  
    oid 1.3.6.1.2.1.2 include;  
}  
view ping-mib {  
    oid 1.3.6.1.2.1.80 include;  
}  
[edit snmp v3]  
notify n1 {  
    tag router1; # Identifies a set of target addresses  
    type trap; # Defines type of notification  
}  
notify n2 {  
    tag host1;  
    type trap;  
}  
notify-filter nf1 {  
    oid .1 include; # Defines which traps to send  
} # In this case, includes all traps  
notify-filter nf2 {  
    oid 1.3.6.1.4.1 include; # Sends enterprise-specific traps only
```

```

}
notify-filter nf3 {
    oid 1.3.6.1.2.1.1.5 include; # Sends BGP traps only
}
snmp-community index1 {
    community-name "$9$JOZi.QF/AtOz3"; # SECRET-DATA
    security-name john; # Matches the security name at the target parameters
    tag host1; # Finds the addresses that are allowed to be used with
}
target-address ta1 {# Associates the target address with the group
    # san-francisco.
    address 10.1.1.1;
    address-mask 255.255.255.0; # Defines the range of addresses
    port 162;
    tag-list router1;
    target-parameters tp1; # Applies configured target parameters
}
target-address ta2 {
    address 10.1.1.2;
    address-mask 255.255.255.0;
    port 162;
    tag-list host1;
    target-parameters tp2;
}
target-address ta3 {
    address 10.1.1.3;
    address-mask 255.255.255.0;
    port 162;
    tag-list "router1 host1";
    target-parameters tp3;
}
target-parameters tp1 { # Defines the target parameters
    notify-filter nf1; # Specifies which notify filter to apply
    parameters {

Minimum SNMPv3 Configuration on a Device Running Junos OS

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [SRX Series](#), [T Series](#)

To configure the minimum requirements for SNMPv3, include the following statements at the `[edit snmp v3]` and `[edit snmp]` hierarchy levels:

NOTE: You must configure at least one view (notify, read, or write) at the `[edit snmp view-name]` hierarchy level.

```

[edit snmp]
view view-name {
    oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
    tag tag-name;
}
notify-filter profile-name {
    oid object-identifier (include | exclude);
}
snmp-community community-index {
    security-name security-name;
}
target-address target-address-name {
    address address;
    target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
    notify-filter profile-name;
    parameters {
        message-processing-model (v1 | v2c | v3);
        security-level (authentication | none | privacy);
        security-model (usm | v1 | v2c);
        security-name security-name;
    }
}
usm {

```

```
local-engine {  
  user username {  
  }  
}  
}  
vacm {  
  access {  
    group group-name {  
      (default-context-prefix | context-prefix context-prefix){  
        security-model (any | usm | v1 | v2c) {  
          security-level (authentication | none | privacy) {  
            notify-view view-name;  
            read-view view-name;  
            write-view view-name;  
          }  
        }  
      }  
    }  
  }  
  security-to-group {  
    security-model (usm | v1 | v2c) {  
      security-name security-name {  
        group group-name;  
      }  
    }  
  }  
}
```

- [Example: SNMPv3 Configuration on page 124](#)

Configuring the SNMPv3 Authentication Type

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

By default, in a Junos OS configuration the SNMPv3 authentication type is set to none.

This topic includes the following sections:

- [Configuring MD5 Authentication on page 129](#)
- [Configuring SHA Authentication on page 129](#)
- [Configuring No Authentication on page 129](#)

Configuring MD5 Authentication

To configure the message digest algorithm (MD5) as the authentication type for an SNMPv3 user, include the **authentication-md5** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
authentication-md5 {  
  authentication-password authentication-password;  
}
```

authentication-password is the password used to generate the key used for authentication.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring SHA Authentication

To configure the secure hash algorithm (SHA) as the authentication type for an SNMPv3 user, include the **authentication-sha** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
authentication-sha {  
  authentication-password authentication-password;  
}
```

authentication-password is the password used to generate the key used for authentication.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring No Authentication

To configure no authentication for an SNMPv3 user, include the **authentication-none** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
authentication-none;
```

Configuring the Encryption Type

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

By default, encryption is set to none.

NOTE: Before you configure encryption, you must configure MD5 or SHA authentication.

Before you configure the `privacy-des`, `privacy-3des` and `privacy-aes128` statements, you must install the `jcrypto` package, and either restart the SNMP process or reboot the router.

This topic includes the following sections:

- [Configuring the Advanced Encryption Standard Algorithm on page 130](#)
- [Configuring the Data Encryption Algorithm on page 131](#)
- [Configuring Triple DES on page 131](#)
- [Configuring No Encryption on page 131](#)

Configuring the Advanced Encryption Standard Algorithm

To configure the Advanced Encryption Standard (AES) algorithm for an SNMPv3 user, include the `privacy-aes128` statement at the `[edit snmp v3 usm local-engine user username]` hierarchy level:

```
[edit snmp v3 usm local-engine user username]  
privacy-aes128 {  
  privacy-password privacy-password;  
}
```

privacy-password is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring the Data Encryption Algorithm

To configure the data encryption algorithm (DES) for an SNMPv3 user, include the **privacy-des** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
privacy-des {
  privacy-password privacy-password;
}
```

privacy-password is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring Triple DES

To configure triple DES for an SNMPv3 user, include the **privacy-3des** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
privacy-3des {
  privacy-password privacy-password;
}
```

privacy-password is the password used to generate the key used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Configuring No Encryption

To configure no encryption for an SNMPv3 user, include the **privacy-none** statement at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
privacy-none;
```

Related Documentation

- [Configuring the SNMPv3 Authentication Type on page 128](#)
- [Defining Access Privileges for an SNMP Group on page 155](#)
- [Configuring the Access Privileges Granted to a Group on page 156](#)
- [Assigning Security Model and Security Name to a Group on page 132](#)

Assigning Security Model and Security Name to a Group

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

To assign security names to groups, include the following statements at the **[edit snmp v3 vacm security-to-group]** hierarchy level:

```
[edit snmp v3 vacm security-to-group]
security-model (usm | v1 | v2c) {
  security-name security-name {
    group group-name;
  }
}
```

This topic includes the following sections:

- [Configuring the Security Model on page 132](#)
- [Assigning Security Names to Groups on page 132](#)
- [Configuring the Group on page 133](#)

Configuring the Security Model

To configure the security model, include the **security-model** statement at the **[edit snmp v3 vacm security-to-group]** hierarchy level:

```
[edit snmp v3 vacm security-to-group]
security-model (usm | v1 | v2c);
```

- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2 security model

Assigning Security Names to Groups

To associate a security name with an SNMPv3 user, or a v1 or v2 community string, include the **security-name** statement at the **[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]** hierarchy level:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
security-name security-name;
```

For SNMPv3, the **security-name** is the username configured at the **[edit snmp v3 usm local-engine user username]** hierarchy level. For SNMPv1 and SNMPv2c, the security name is the community string configured at the **[edit snmp v3 snmp-community community-index]** hierarchy level. For information about configuring usernames, see [“Creating SNMPv3 Users” on page 123](#). For information about configuring a community string, see [“Configuring the SNMPv3 Community” on page 168](#).

NOTE: The USM security name is separate from the SNMPv1 and SNMPv2c security name. If you support SNMPv1 and SNMPv2c in addition to SNMPv3, you must configure separate security names within the security-to-group configuration at the `[edit snmp v3 vacm access]` hierarchy level.

Configuring the Group

After you have created SNMPv3 users, or v1 or v2 security names, you associate them with a group. A group is a set of security names belonging to a particular security model. A group defines the access rights for all users belonging to it. Access rights define what SNMP objects can be read, written to, or created. A group also defines what notifications a user is allowed to receive.

If you already have a group that is configured with all of the view and access permissions that you want to give a user, you can add the user to that group. If you want to give a user view and access permissions that no other groups have, or if you do not have any groups configured, create a group and add the user to it.

To configure the access privileges granted to a group, include the **group** statement at the `[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name security-name]` hierarchy level:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
security-name]
group group-name;
```

group-name identifies a collection of SNMP security names that share the same access policy. For more information about groups, see “Defining Access Privileges for an SNMP Group” on page 155.

Example: Security Group Configuration

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [SRX Series](#), [T Series](#)

Assign security names to groups:

```
vacm {
  security-to-group {
    security-model usm {
      security-name user1 {
        group group1;
      }
      security-name user2 {
        group group2;
      }
      security-name user3 {
        group group3;
      }
    }
  }
}
```

- Related Documentation**
- [Assigning Security Model and Security Name to a Group on page 132](#)
 - [Complete SNMPv3 Configuration Statements on page 195](#)
 - [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 127](#)

Example: Configuring the Tag List

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

In the following example, two tag entries (**router1** and **router2**) are defined at the **[edit snmp v3 notify *notify-name*]** hierarchy level. When an event triggers a notification, Junos OS sends a trap to all target addresses that have **router1** or **router2** configured in their target-address tag list. This results in the first two targets getting one trap each, and the third target getting two traps.

```
[edit snmp v3]
notify n1 {
    tag router1; # Identifies a set of target addresses
    type trap; # Defines the type of notification
}
notify n2 {
    tag router2;
    type trap;
}
target-address ta1 {
    address 10.1.1.1;
    address-mask 255.255.255.0;
    port 162;
    tag-list router1;
    target-parameters tp1;
}
target-address ta2 {
    address 10.1.1.2;
    address-mask 255.255.255.0;
    port 162;
    tag-list router2;
    target-parameters tp2;
}
target-address ta3 {
    address 10.1.1.3;
    address-mask 255.255.255.0;
    port 162;
    tag-list "router1 router2"; #Define multiple tags in the target address tag list
    target-parameters tp3;
}
```

Example: Creating SNMPv3 Users Configuration

Supported Platforms [SRX Series](#)

Define SNMPv3 users:

```
[edit]
snmp {
  v3 {
    usm {
      local-engine {
        user user1 {
          authentication-md5 {
            authentication-password authentication-password;
          }
          privacy-des {
            privacy-password password;
          }
        }
        user user2 {
          authentication-sha {
            authentication-password authentication-password;
          }
          privacy-none;
        }
        user user3 {
          authentication-none;
          privacy-none;
        }
        user user4 {
          authentication-md5 {
            authentication-password authentication-password;
          }
          privacy-des {
            privacy-password authentication-password;
          }
        }
        user user5 {
          authentication-sha {
            authentication-password authentication-password;
          }
          privacy-aes128 {
            privacy-password authentication-password;
          }
        }
      }
    }
  }
}
```

- [Example: Configuring SNMPv3 Trap Notification on page 153](#)

Configuring SNMP Trap Options

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router to a single address regardless of the outgoing interface. In addition, you can set the agent address of the SNMPv1 traps. For more information about the contents of SNMPv1 traps, see RFC 1157.

NOTE: SNMP cannot be associated with any routing instances other than the master routing instance.

To configure SNMP trap options, include the **trap-options** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
  enterprise-oid
  logical-system
  routing-instance
  source-address address;
}
```

You must also configure a trap group for the trap options to take effect. For information about trap groups, see [“Configuring SNMP Trap Groups” on page 141](#).

This topic contains the following sections:

- [Configuring the Source Address for SNMP Traps on page 138](#)
- [Configuring the Agent Address for SNMP Traps on page 140](#)
- [Adding snmpTrapEnterprise Object Identifier to Standard SNMP Traps on page 140](#)

Configuring the Source Address for SNMP Traps

You can configure the source address of trap packets in many ways: **lo0**, a valid IPv4 address configured on one of the router interfaces, a logical-system address, or the address of a routing-instance. The value **lo0** indicates that the source address of the SNMP trap packets is set to the lowest loopback address configured on the interface **lo0**.

You can configure the source address of trap packets in one of the following formats:

- a valid IPv4 address configured on one of the router interfaces
- **lo0**; that is the lowest loopback address configured on the interface **lo0**.
- a logical-system name
- a routing-instance name

A valid IPv4 Address As the Source Address

To specify a valid interface address as the source address for SNMP traps on one of the router interfaces, include the **source-address** statement at the **[edit snmp trap-options]** hierarchy level:

```
[edit snmp trap-options]
source-address address;
```

address is a valid IPv4 address configured on one of the router interfaces.

The Lowest Loopback Address As the Source Address

To specify the source address of the SNMP traps so that they use the lowest loopback address configured on the interface **lo0** as the source address, include the **source-address** statement at the **[edit snmp trap-options]** hierarchy level:

```
[edit snmp trap-options]
source-address lo0;
```

To enable and configure the loopback address, include the **address** statement at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level:

```
[edit interfaces]
lo0 {
  unit 0 {
    family inet {
      address ip-address;
    }
  }
}
```

To configure the loopback address as the source address of trap packets:

```
[edit snmp]
trap-options {
  source-address lo0;
}
trap-group "urgent-dispatcher" {
  version v2;
  categories link startup;
  targets {
    192.168.10.22;
    172.17.1.2;
  }
}
[edit interfaces]
lo0 {
  unit 0 {
    family inet {
      address 10.0.0.1/32;
      address 127.0.0.1/32;
    }
  }
}
```

In this example, the IP address 10.0.0.1 is the source address of every trap sent from this router.

Logical System Name as the Source Address To specify a logical system name as the source address of SNMP traps, include the **logical-system** *logical-system-name* statement at the **[edit snmp trap-options]** hierarchy level.

For example, the following configuration sets logical system name **ls1** as the source address of SNMP traps:

```
[edit snmp]
trap-options {
  logical-system ls1;
}
```

Routing Instance Name as the Source Address To specify a routing instance name as the source address of SNMP traps, include the **routing-instance** *routing-instance-name* statement at the **[edit snmp trap-options]** hierarchy level.

For example, the following configuration sets the routing instance name **ri1** as the source address for SNMP traps:

```
[edit snmp]
trap-options {
  routing-instance ri1;
}
```

Configuring the Agent Address for SNMP Traps

The agent address is only available in SNMPv1 trap packets (see RFC 1157). By default, the router's default local address is used in the agent address field of the SNMPv1 trap. To configure the agent address, include the **agent-address** statement at the **[edit snmp trap-options]** hierarchy level. Currently, the agent address can only be the address of the outgoing interface:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
}
```

To configure the outgoing interface as the agent address:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
}
trap-group "urgent-dispatcher" {
  version v1;
  categories link startup;
  targets {
    192.168.10.22;
    172.17.1.2;
  }
}
```

In this example, each SNMPv1 trap packet sent has its agent address value set to the IP address of the outgoing interface.

Adding snmpTrapEnterprise Object Identifier to Standard SNMP Traps

The **snmpTrapEnterprise** object helps you identify the enterprise that has defined the trap. Typically, the **snmpTrapEnterprise** object appears as the last varbind in enterprise-specific SNMP version 2 traps. However, starting Release 10.0, Junos OS enables you to add the **snmpTrapEnterprise** object identifier to standard SNMP traps as well.

To add **snmpTrapEnterprise** to standard traps, include the **enterprise-oid** statement at the **[edit snmp trap-options]** hierarchy level. If the **enterprise-oid** statement is not included in the configuration, **snmpTrapEnterprise** is added only for enterprise-specific traps.

```
[edit snmp]
trap-options {
  enterprise-oid;
}
```

Configuring the Trap Notification Filter

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

SNMPv3 uses the notify filter to define which traps (or which objects from which traps) are sent to the network management system (NMS). The trap notification filter limits the type of traps that are sent to the NMS.

Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). You can also use the wildcard character asterisk (*) in the object identifier (OID) to specify object identifiers that match a particular pattern.

To configure the trap notifications filter, include the **notify-filter** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
  notify-filter profile-name;
```

profile-name is the name assigned to the notify filter.

By default, the OID is set to **include**. To define access to traps (or objects from traps), include the **oid** statement at the **[edit snmp v3 notify-filter profile-name]** hierarchy level:

```
[edit snmp v3 notify-filter profile-name]
  oid oid (include | exclude);
```

oid is the object identifier. All MIB objects represented by this statement have the specified OID as a prefix. It can be specified either by a sequence of dotted integers or by a subtree name.

- **include**—Include the subtree of MIB objects represented by the specified OID.
- **exclude**—Exclude the subtree of MIB objects represented by the specified OID.

- [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 127](#)

Configuring SNMP Trap Groups

Supported Platforms [LN Series](#), [SRX Series](#)

You can create and name a group of one or more types of SNMP traps and then define which systems receive the group of SNMP traps. The trap group must be configured for SNMP traps to be sent. To create an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  routing-instance instance;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 or IPv6 address of each recipient, not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement. For information about the category to which the traps belong, see the [“Standard SNMP Traps Supported on Devices Running Junos OS” on page 73](#) and [“Juniper Networks Enterprise-Specific SNMP Traps” on page 73](#) topics.

Specify the routing instance used by the trap group in the **routing-instance** statement. All targets configured in the trap group use this routing instance.

A trap group can receive the following categories:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications
- **link**—Link-related notifications (up-down transitions, DS-3 and DS-1 line status change, IPv6 interface state change, and Passive Monitoring PIC overload)

NOTE: To send Passive Monitoring PIC overload interface traps, select the **link** trap category.

- **remote-operations**—Remote operation notifications
- **rmon-alarm**—Alarm for RMON events
- **routing**—Routing protocol notifications
- **sonet-alarms**—SONET/SDH alarms

NOTE: If you omit the SONET/SDH subcategories, all SONET/SDH trap alarm types are included in trap notifications.

- **loss-of-light**—Loss of light alarm notification
- **pll-lock**—PLL lock alarm notification
- **loss-of-frame**—Loss of frame alarm notification
- **loss-of-signal**—Loss of signal alarm notification
- **severely-errored-frame**—Severely errored frame alarm notification
- **line-ais**—Line alarm indication signal (AIS) alarm notification
- **path-ais**—Path AIS alarm notification
- **loss-of-pointer**—Loss of pointer alarm notification
- **ber-defect**—SONET/SDH bit error rate alarm defect notification
- **ber-fault**—SONET/SDH error rate alarm fault notification
- **line-remote-defect-indication**—Line remote defect indication alarm notification
- **path-remote-defect-indication**—Path remote defect indication alarm notification
- **remote-error-indication**—Remote error indication alarm notification
- **unequipped**—Unequipped alarm notification
- **path-mismatch**—Path mismatch alarm notification
- **loss-of-cell**—Loss of cell delineation alarm notification
- **vt-ais**—Virtual tributary (VT) AIS alarm notification
- **vt-loss-of-pointer**—VT loss of pointer alarm notification
- **vt-remote-defect-indication**—VT remote defect indication alarm notification
- **vt-unequipped**—VT unequipped alarm notification
- **vt-label-mismatch**—VT label mismatch error notification
- **vt-loss-of-cell**—VT loss of cell delineation notification
- **startup**—System warm and cold starts
- **vrrp-events**—Virtual Router Redundancy Protocol (VRRP) events such as new-master or authentication failures

If you include SONET/SDH subcategories, only those SONET/SDH trap alarm types are included in trap notifications.

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see [version](#).

Configuring SNMP Trap Options and Groups on a Device Running Junos OS

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Some carriers have more than one trap receiver that forwards traps to a central NMS. This allows for more than one path for SNMP traps from a router to the central NMS through different trap receivers. A device running Junos OS can be configured to send the same copy of each SNMP trap to every trap receiver configured in the trap group.

The source address in the IP header of each SNMP trap packet is set to the address of the outgoing interface by default. When a trap receiver forwards the packet to the central NMS, the source address is preserved. The central NMS, looking only at the source address of each SNMP trap packet, assumes that each SNMP trap came from a different source.

In reality, the SNMP traps came from the same router, but each left the router through a different outgoing interface.

The statements discussed in the following sections are provided to allow the NMS to recognize the duplicate traps and to distinguish SNMPv1 traps based on the outgoing interface.

To configure SNMP trap options and trap groups, include the **trap-options** and **trap-group** statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-options {
  agent-address outgoing-interface;
  source-address address;
}
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

Configuring SNMPv3 Traps on a Device Running Junos OS

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [T Series](#)

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see [“Configuring SNMP Informs” on page 121](#).

The target address defines a management application’s address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

NOTE: When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the [\[edit snmp v3 vacm access\]](#) and [\[edit snmp v3 vacm security-to-group\]](#) hierarchy levels.

To configure SNMP traps, include the following statements at the [\[edit snmp v3\]](#) hierarchy level:

```
[edit snmp v3]
  notify name {
    tag tag-name;
    type trap;
  }
  notify-filter name {
    oid object-identifier (include | exclude);
  }
  target-address target-address-name {
    address address;
    address-mask address-mask;
    logical-system logical-system;
    port port-number;
    routing-instance instance;
    tag-list tag-list;
    target-parameters target-parameters-name;
  }
  target-parameters target-parameters-name {
    notify-filter profile-name;
    parameters {
      message-processing-model (v1 | v2c | v3);
      security-level (authentication | none | privacy);
      security-model (usm | v1 | v2c);
      security-name security-name;
    }
  }
}
```

Configuring the SNMPv3 Trap Notification

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [T Series](#)

The **notify** statement specifies the type of notification (trap) and contains a single tag. The tag defines a set of target addresses to receive a trap. The tag list contains one or more tags and is configured at the **[edit snmp v3 target-address *target-address-name*]** hierarchy level. If the tag list contains this tag, Junos OS sends a notification to all the target addresses associated with this tag.

To configure the trap notifications, include the **notify** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
notify name {
  tag tag-name;
  type trap;
}
```

name is the name assigned to the notification.

tag-name defines the target addresses to which this notification is sent. This notification is sent to all the target-addresses that have this tag in their tag list. The **tag-name** is not included in the notification.

trap is the type of notification.

NOTE: Each notify entry name must be unique.

Junos OS supports two types of notification: **trap** and **inform**.

For information about how to configure the tag list, see [“Configuring the Trap Target Address” on page 149](#).

Example: Configuring SNMP Trap Groups

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Set up a trap notification list named **urgent-dispatcher** for link and startup traps. This list is used to identify the network management hosts (**1.2.3.4** and **fe80::1:2:3:4**) to which traps generated by the local router should be sent. The name specified for a trap group is used as the SNMP community string when the agent sends traps to the listed targets.

```
[edit]
snmp {
  trap-group "urgent-dispatcher" {
    version v2;
    categories link startup;
    targets {
      1.2.3.4;
      fe80::1:2:3:4;
    }
  }
}
```

Configuring the Trap Target Address

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

The target address defines a management application's address and parameters that are used in sending notifications. It can also identify management stations that are allowed to use specific community strings. When you receive a packet with a recognized community string and a tag is associated with it, Junos OS looks up all the target addresses with this tag and verifies that the source address of this packet matches one of the configured target addresses.

NOTE: You must configure the address mask when you configure the SNMP community.

To specify where you want the traps to be sent and define what SNMPv1 and SNMPv2cc packets are allowed, include the **target-address** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
target-address target-address-name;
```

target-address-name is the string that identifies the target address.

To configure the target address properties, include the following statements at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
address address;
address-mask address-mask;
logical-system logical-system;
port port-number;
routing-instance instance;
tag-list tag-list;
target-parameters target-parameters-name;
```

This section includes the following topics:

- [Configuring the Address on page 148](#)
- [Configuring the Address Mask on page 148](#)
- [Configuring the Port on page 149](#)
- [Configuring the Routing Instance on page 149](#)
- [Configuring the Trap Target Address on page 149](#)
- [Applying Target Parameters on page 150](#)

Configuring the Address

To configure the address, include the **address** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
address address;
```

address is the SNMP target address.

Configuring the Address Mask

The address mask specifies a set of addresses that are allowed to use a community string and verifies the source addresses for a group of target addresses.

To configure the address mask, include the **address-mask** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
address-mask address-mask;
```

address-mask combined with the address defines a range of addresses. For information about how to configure the community string, see [“Configuring the SNMPv3 Community” on page 168](#).

Configuring the Port

By default, the UDP port is set to 162. To configure a different port number, include the **port** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
port port-number;
```

port-number is the SNMP target port number.

Configuring the Routing Instance

Traps are sent over the default routing instance. To configure the routing instance for sending traps, include the **routing-instance** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
routing-instance instance;
```

instance is the name of the routing instance. To configure a routing instance within a logical system, specify the logical system name followed by the routing instance name. Use a slash (/) to separate the two names (for example, **test-lr/test-ri**). To configure the default routing instance on a logical system, specify the logical system name followed by **default** (for example, **test-lr/default**).

Configuring the Trap Target Address

Each **target-address** statement can have one or more tags configured in its tag list. Each tag can appear in more than one tag list. When a significant event occurs on the network device, the tag list identifies the targets to which a notification is sent.

To configure the tag list, include the **tag-list** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
tag-list "tag-list";
```

tag-list specifies one or more tags as a space-separated list enclosed within double quotes.

For an example of tag list configuration, see [“Example: Configuring the Tag List” on page 134](#).

For information about how to specify a tag at the **[edit snmp v3 notify notify-name]** hierarchy level, see [“Configuring the SNMPv3 Trap Notification” on page 146](#).

NOTE: When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Configure access privileges at the **[edit snmp v3 vacm access]** hierarchy level.

Applying Target Parameters

The **target-parameters** statement at the **[edit snmp v3]** hierarchy level applies the target parameters configured at the **[edit snmp v3 target-parameters target-parameters-name]** hierarchy level.

To reference configured target parameters, include the **target-parameters** statement at the **[edit snmp v3 target-address target-address-name]** hierarchy level:

```
[edit snmp v3 target-address target-address-name]
  target-parameters target-parameters-name;
```

target-parameters-name is the name associated with the message processing and security parameters that are used in sending notifications to a particular management target.

Defining and Configuring the Trap Target Parameters

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target.

To define a set of target parameters, include the **target-parameters** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
  target-parameters target-parameters-name;
```

target-parameters-name is the name assigned to the target parameters.

To configure target parameter properties, include the following statements at the **[edit snmp v3 target-parameters target-parameter-name]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name]
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | V3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
```

This topic includes the following sections:

- [Applying the Trap Notification Filter on page 151](#)
- [Configuring the Target Parameters on page 151](#)

Applying the Trap Notification Filter

To apply the trap notification filter, include the **notify-filter** statement at the **[edit snmp v3 target-parameters *target-parameter-name*]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name]  
  notify-filter profile-name;
```

profile-name is the name of a configured notify filter. For information about configuring notify filters, see “[Configuring the Trap Notification Filter](#)” on page 141.

Configuring the Target Parameters

To configure target parameter properties, include the following statements at the **[edit snmp v3 target-parameters *target-parameter-name* parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]  
  message-processing-model (v1 | v2c | v3);  
  security-level (authentication | none | privacy);  
  security-model (usm | v1 | v2c);  
  security-name security-name;
```

This section includes the following topics:

- [Configuring the Message Processing Model on page 151](#)
- [Configuring the Security Model on page 152](#)
- [Configuring the Security Level on page 152](#)
- [Configuring the Security Name on page 152](#)

Configuring the Message Processing Model

The message processing model defines which version of SNMP to use when generating SNMP notifications. To configure the message processing model, include the **message-processing-model** statement at the **[edit snmp v3 target-parameters *target-parameter-name* parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]  
  message-processing-model (v1 | v2c | v3);
```

- **v1**—SNMPv1 message processing model
- **v2c**—SNMPv2c message processing model
- **v3**—SNMPv3 message processing model

Configuring the Security Model

To define the security model to use when generating SNMP notifications, include the **security-model** statement at the **[edit snmp v3 target-parameters *target-parameter-name* parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
  security-model (usm | v1 | v2c);
```

- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2c security model

Configuring the Security Level

The **security-level** statement specifies whether the trap is authenticated and encrypted before it is sent.

To configure the security level to use when generating SNMP notifications, include the **security-level** statement at the **[edit snmp v3 target-parameters *target-parameter-name* parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
  security-level (authentication | none | privacy);
```

- **authentication**—Provides authentication but no encryption.
- **none**—No security. Provides no authentication and no encryption.
- **privacy**—Provides authentication and encryption.

NOTE: If you are configuring the SNMPv1 or SNMPv2c security model, use **none** as your security level. If you are configuring the SNMPv3 (USM) security model, use the **authentication** or **privacy** security level.

Configuring the Security Name

To configure the security name to use when generating SNMP notifications, include the **security-name** statement at the **[edit snmp v3 target-parameters *target-parameter-name* parameters]** hierarchy level:

```
[edit snmp v3 target-parameters target-parameter-name parameters]
  security-name security-name;
```

If the USM security model is used, the **security-name** identifies the user that is used when the notification is generated. If the v1 or v2c security models are used, **security-name** identifies the SNMP community used when the notification is generated.

NOTE: The access privileges for the group associated with a security name must allow this notification to be sent.

If you are using the v1 or v2 security models, the security name at the [edit snmp v3 vacm security-to-group] hierarchy level must match the security name at the [edit snmp v3 snmp-community *community-index*] hierarchy level.

Example: Configuring SNMPv3 Trap Notification

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

Specify three sets of destinations to send traps:

```
[edit snmp v3]
  notify n1 {
    tag router1;
    type trap;
  }
  notify n2 {
    tag router2;
    type trap;
  }
  notify n3 {
    tag router3;
    type trap;
  }
```

CHAPTER 11

Access Privileges

- [Defining Access Privileges for an SNMP Group on page 155](#)
- [Configuring the Access Privileges Granted to a Group on page 156](#)
- [Example: Access Privilege Configuration on page 159](#)

Defining Access Privileges for an SNMP Group

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

The SNMP version 3 (SNMPv3) uses the view-based access control model (VACM), which allows you to configure the access privileges granted to a group. Access is controlled by filtering the MIB objects available for a specific operation through a predefined view. You assign views to determine the objects that are visible for read, write, and notify operations for a particular group, using a particular context, a particular security model (v1, v2c, or usm), and particular security level (authenticated, privacy, or none). For information about how to configure views, see [“Configuring MIB Views” on page 118](#).

You define user access to management information at the **[edit snmp v3 vacm]** hierarchy level. All access control within VACM operates on groups, which are collections of users as defined by USM, or community strings as defined in the SNMPv1 and SNMPv2c security models. The term **security-name** refers to these generic end users. The group to which a specific security name belongs is configured at the **[edit snmp v3 vacm security-to-group]** hierarchy level. That security name can be associated with a group defined at the **[edit snmp v3 vacm security-to-group]** hierarchy level. A group identifies a collection of SNMP users that share the same access policy. You then define the access privileges associated with a group at the **[edit snmp v3 vacm access]** hierarchy level. Access privileges are defined using views. For each group, you can apply different views depending on the SNMP operation; for example, read (**get**, **getNext**, or **getBulk**) write (**set**), notifications, the security level used (authentication, privacy, or none), and the security model (v1, v2c, or usm) used within an SNMP request.

You configure members of a group with the **security-name** statement. For v3 packets using USM, the security name is the same as the username. For SNMPv1 or SNMPv2c packets, the security name is determined based on the community string. Security names are specific to a security model. If you are also configuring VACM access policies for SNMPv1 or SNMPv2c packets, you must assign security names to groups for each security model (SNMPv1 or SNMPv2c) at the **[edit snmp v3 vacm security-to-group]** hierarchy

level. You must also associate a security name with an SNMP community at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

To configure the access privileges for an SNMP group, include statements at the **[edit snmp v3 vacm]** hierarchy level:

```
[edit snmp v3 vacm]
access {
  group group-name {
    (default-context-prefix | context-prefix context-prefix){
      security-model (any | usm | v1 | v2c) {
        security-level (authentication | none | privacy) {
          notify-view view-name;
          read-view view-name;
          write-view view-name;
        }
      }
    }
  }
}
security-to-group {
  security-model (usm | v1 | v2c) {
    security-name security-name {
      group group-name;
    }
  }
}
```

Configuring the Access Privileges Granted to a Group

Supported Platforms LN Series, M Series, MX Series, PTX Series, SRX Series, T Series

This topic includes the following sections:

- [Configuring the Group on page 156](#)
- [Configuring the Security Model on page 157](#)
- [Configuring the Security Level on page 157](#)
- [Associating MIB Views with an SNMP User Group on page 157](#)

Configuring the Group

To configure the access privileges granted to a group, include the **group** statement at the **[edit snmp v3 vacm access]** hierarchy level:

```
[edit snmp v3 vacm access]
```

group *group-name*;

group-name is a collection of SNMP users that belong to a common SNMP list that defines an access policy. Users belonging to a particular SNMP group inherit all access privileges granted to that group.

Configuring the Security Model

To configure the security model, include the **security-model** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix)]
security-model (any | usm | v1 | v2c);
```

- **any**—Any security model
- **usm**—SNMPv3 security model
- **v1**—SNMPv1 security model
- **v2c**—SNMPv2c security model

Configuring the Security Level

To configure the access privileges granted to packets with a particular security level, include the **security-level** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name default-context-prefix security-model (any
| usm | v1 | v2c)]
security-level (authentication | none | privacy);
```

- **none**—Provides no authentication and no encryption.
- **authentication**—Provides authentication but no encryption.
- **privacy**—Provides authentication and encryption.

NOTE: Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or SNMPv2c security model, use **none** as your security level. If you are configuring the SNMPv3 security model (USM), use the **authentication**, **none**, or **privacy** security level.

Associating MIB Views with an SNMP User Group

MIB views define access privileges for members of a group. Separate views can be applied for each SNMP operation (read, write, and notify) within each security model (usm, v1, and v2c) and each security level (authentication, none, and privacy) supported by SNMP.

To associate MIB views with an SNMP user group, include the following statements at the `[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]` hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
  | privacy)]
  notify-view view-name;
  read-view view-name;
  write-view view-name;
```

NOTE: You must associate at least one view (notify, read, or write) at the `[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]` hierarchy level.

You must configure the MIB view at the `[edit snmp view view-name]` hierarchy level. For information about how to configure MIB views, see [“Configuring MIB Views” on page 118](#).

This section describes the following topics related to this configuration:

- [Configuring the Notify View on page 158](#)
- [Configuring the Read View on page 158](#)
- [Configuring the Write View on page 159](#)

Configuring the Notify View

To associate notify access with an SNMP user group, include the **notify-view** statement at the `[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]` hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
  | privacy)]
  notify-view view-name;
```

view-name specifies the notify access, which is a list of notifications that can be sent to each user in an SNMP group. A view name cannot exceed 32 characters.

Configuring the Read View

To associate a read view with an SNMP group, include the **read-view** statement at the `[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]` hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
  | privacy)]
  read-view view-name;
```

view-name specifies read access for an SNMP user group. A view name cannot exceed 32 characters.

Configuring the Write View

To associate a write view with an SNMP user group, include the **write-view** statement at the **[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]** hierarchy level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication | none
| privacy)]
write-view view-name;
```

view-name specifies write access for an SNMP user group. A view name cannot exceed 32 characters.

Example: Access Privilege Configuration

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Define access privileges:

```
[edit snmp v3]
access {
  group group1 {
    default-context-prefix {
      security-model usm {          #Define an SNMPv3 security model
        security-level privacy {
          notify-view nv1;
          read-view rv1;
          write-view wv1;
        }
      }
    }
  }
  context-prefix lr1/ri1 { # routing instance ri1 in logical system lr1
    security-model usm {
      security-level privacy {
        notify-view nv1;
        read-view rv1;
        write-view wv1;
      }
    }
  }
}
```

```
}
group group2 {
  default-context-prefix {
    security-model usm {      #Define an SNMPv3 security model
      security-level authentication {
        read-view rv2;
        write-view wv2;
      }
    }
  }
}
group group3 {
  default-context-prefix {
    security-model v1 {      #Define an SNMPv3 security model
      security-level none {
        read-view rv3;
        write-view wv3;
      }
    }
  }
}
}
```

CHAPTER 12

Routing Instances

- [Enabling SNMP Access over Routing Instances on page 161](#)
- [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 161](#)
- [Example: Configuring Interface Settings for a Routing Instance on page 162](#)
- [Configuring Access Lists for SNMP Access over Routing Instances on page 164](#)

Enabling SNMP Access over Routing Instances

Supported Platforms [LN Series, M Series, MX Series, PTX Series, SRX Series, T Series](#)

To enable SNMP managers in routing instances other than the default routing instance to access SNMP information, include the **routing-instance-access** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  routing-instance-access;
```

If this statement is not included in the SNMP configuration, SNMP managers from routing instances other than the default routing instance cannot access SNMP information.

- Related Documentation**
- [Understanding SNMP Support for Routing Instances on page 86](#)
 - [Identifying a Routing Instance on page 85](#)
 - [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 161](#)
 - [Configuring Access Lists for SNMP Access over Routing Instances on page 164](#)

Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community

Supported Platforms [LN Series, M Series, MX Series, PTX Series, SRX Series, T Series](#)

You can specify the routing instance along with the client information when you add a client to an SNMP community. To specify the routing instance to which a client belongs, include the **routing-instance** statement followed by the routing instance name and client information in the SNMP configuration.

The following example shows the configuration statement to add routing instance **test-ri** to SNMP community **community1**.

NOTE: Routing instances specified at the `[edit snmp community community-name]` hierarchy level are added to the default logical system in the community.

```
[edit snmp]
community community1 {
  clients {
    10.209.152.33/32;
  }
  routing-instance test-ri {
    clients {
      10.19.19.1/32;
    }
  }
}
```

If the routing instance is defined within a logical system, include the **routing-instance** statement at the `[edit snmp community community-name logical-system logical-system-name]` hierarchy level, as in the following example:

```
[edit snmp]
community community1 {
  clients {
    10.209.152.33/32;
  }
  logical-system test-LS {
    routing-instance test-ri {
      clients {
        10.19.19.1/32;
      }
    }
  }
}
```

Related Documentation

- [Enabling SNMP Access over Routing Instances on page 161](#)
- [Configuring Access Lists for SNMP Access over Routing Instances on page 164](#)
- [Example: Configuring Interface Settings for a Routing Instance on page 162](#)

Example: Configuring Interface Settings for a Routing Instance

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

This example shows an `802.3ad ae0` interface configuration allocated to a routing instance named `INFrtid`:

```
[edit chassis]
aggregated-devices {
  ethernet {
```

```

        device-count 5;
    }
}
[edit interfaces ae0]
vlan-tagging;
aggregated-ether-options {
    minimum-links 2;
    link-speed 100m;
}
unit 0 {
    vlan-id 100;
    family inet {
        address 10.1.0.1/24;
    }
}
[edit interfaces fe-1/1/0]
fastether-options {
    802.3ad ae0;
}
[edit interfaces fe-1/1/1]
fastether-options {
    802.3ad ae0;
}
[edit routing-instances]
INFrtid {
    instance-type virtual-router;
    interface fe-1/1/0.0;
    interface fe-1/1/1.0;
    interface fe-1/1/5.0;
    interface ae0.0;
    protocols {
        ospf {
            area 0.0.0.0 {
                interface all;
            }
        }
    }
}
}

```

The following **snmpwalk** command shows how to retrieve SNMP-related information from **router1** and the 802.3ae bundle interface belonging to routing instance **INFrtid** with the SNMP community **public**:

```

router# snmpwalk -Os router1 INFrtid@public dot3adAggTable
dot3adAggMACAddress.59 = 0:90:69:92:93:f0
dot3adAggMACAddress.65 = 0:90:69:92:93:f0
dot3adAggActorSystemPriority.59 = 0
dot3adAggActorSystemPriority.65 = 0
dot3adAggActorSystemID.59 = 0:0:0:0:0:0
dot3adAggActorSystemID.65 = 0:0:0:0:0:0
dot3adAggAggregateOrIndividual.59 = true(1)
dot3adAggAggregateOrIndividual.65 = true(1)
dot3adAggActorAdminKey.59 = 0
dot3adAggActorAdminKey.65 = 0
dot3adAggActorOperKey.59 = 0
dot3adAggActorOperKey.65 = 0

```

```
dot3adAggPartnerSystemID.59 = 0:0:0:0:0:0
dot3adAggPartnerSystemID.65 = 0:0:0:0:0:0
dot3adAggPartnerSystemPriority.59 = 0
dot3adAggPartnerSystemPriority.65 = 0
dot3adAggPartnerOperKey.59 = 0
dot3adAggPartnerOperKey.65 = 0
dot3adAggCollectorMaxDelay.59 = 0
dot3adAggCollectorMaxDelay.65 = 0
```

- Related Documentation**
- [Understanding SNMP Support for Routing Instances on page 86](#)
 - [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 161](#)

Configuring Access Lists for SNMP Access over Routing Instances

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

You can create and maintain access lists to manage access to SNMP information. Access list configuration enables you to allow or deny SNMP access to clients of a specific routing instance.

The following example shows how to create an access list:

```
[edit snmp]
routing-instance-access {
  access-list {
    ri1 restrict;
    ls1/default;
    ls1/ri2;
    ls1*;
  }
}
```

The configuration given in the example:

- Restricts clients in **ri1** from accessing SNMP information.
- Allows clients in **ls1/default**, **ls1/ri2**, and all other routing instances with names starting with **ls1** to access SNMP information.

You can use the wildcard character (*) to represent a string in the routing instance name.

NOTE: You cannot restrict the SNMP manager of the default routing instance from accessing SNMP information.

- Related Documentation**
- [Understanding SNMP Support for Routing Instances on page 86](#)
 - [Enabling SNMP Access over Routing Instances on page 161](#)
 - [Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 161](#)

CHAPTER 13

Community Strings

- [Configuring the SNMP Community String on page 165](#)
- [Examples: Configuring the SNMP Community String on page 166](#)
- [Adding a Group of Clients to an SNMP Community on page 167](#)
- [Configuring the SNMPv3 Community on page 168](#)
- [Example: SNMPv3 Community Configuration on page 170](#)

Configuring the SNMP Community String

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community name {
  authorization authorization;
  clients {
    default restrict;
    address restrict;
  }
  view view-name;
}
```

If the community name contains spaces, enclose it in quotation marks (" ").

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported MIB objects that are accessible with read-only privileges; no MIB objects are accessible with read-write privileges. For more information about the **view** statement, see [“Configuring MIB Views” on page 118](#).

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are allowed. For **address**, you must specify an IPv4 or IPv6 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not

explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local router.

NOTE: Community names must be unique. You cannot configure the same community name at the [edit snmp community] and [edit snmp v3 snmp-community *community-index*] hierarchy levels.

**Related
Documentation**

- [Adding a Group of Clients to an SNMP Community on page 167](#)
- [Configuring SNMP on a Device Running Junos OS on page 109](#)
- [Configuration Statements at the \[edit snmp\] Hierarchy Level on page 192](#)
- [Examples: Configuring the SNMP Community String on page 166](#)

Examples: Configuring the SNMP Community String

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Grant read-only access to all clients. With the following configuration, the system responds to SNMP **Get**, **GetNext**, and **GetBulk** requests that contain the community string **public**:

```
[edit]
snmp {
  community public {
    authorization read-only;
  }
}
```

Grant all clients read-write access to the ping MIB and **jnxPingMIB**. With the following configuration, the system responds to SNMP **Get**, **GetNext**, **GetBulk**, and **Set** requests that contain the community string **private** and specify an OID contained in the ping MIB or **jnxPingMIB** hierarchy:

```
[edit]
snmp {
  view ping-mib-view {
    oid pingMIB include;
    oid jnxPingMIB include;
    community private {
      authorization read-write;
      view ping-mib-view;
    }
  }
}
```

The following configuration allows read-only access to clients with IP addresses in the range 1.2.3.4/24, and denies access to systems in the range fe80::1:2:3:4/64:

```
[edit]
snmp {
  community field-service {
    authorization read-only;
    clients {
```

```

    default restrict; # Restrict access to all SNMP clients not explicitly
    # listed on the following lines.
    1.2.3.4/24; # Allow access by all clients in 1.2.3.4/24 except
    fe80::1:2:3:4/64 restrict;# fe80::1:2:3:4/64.
  }
}
}

```

**Related
Documentation**

- [Configuring the SNMP Community String on page 165](#)

Adding a Group of Clients to an SNMP Community

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the **client-list-name** *name* statement at the **[edit snmp community community-name]** hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the **client-list** statement followed by the IP addresses of the clients at the **[edit snmp]** hierarchy level:

```

[edit snmp]
  client-list client-list-name {
    ip-addresses;
  }

```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community community-name]** hierarchy level:

```

[edit snmp community community-name]
  client-list-name client-list-name;

```

NOTE: The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```

[edit]
snmp {
  client-list clientlist1 {
    10.1.1.1/32;
    10.2.2.2/32;
  }
}

```

The following example shows how to add a client list to an SNMP community:

```

[edit]
snmp {
  community community1 {

```

```
        authorization read-only;
        client-list-name clientlist1;
    }
}
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]
policy-options {
  prefix-list prefixlist {
    10.3.3.3/32;
    10.5.5.5/32;
  }
}
snmp {
  community community2 {
    client-list-name prefixlist;
  }
}
```

- Related Documentation
- [client-list on page 206](#)
 - [client-list-name on page 207](#)

Configuring the SNMPv3 Community

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

The SNMP community defines the relationship between an SNMP server system and the client systems. This statement is optional.

To configure the SNMP community, include the **snmp-community** statement at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
  snmp-community community-index;
```

community-index is the index for the SNMP community.

To configure the SNMP community properties, include the following statements at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level:

```
[edit snmp v3 snmp-community community-index]
  community-name community-name;
  security-name security-name;
  tag tag-name;
```

This section includes the following topics:

- [Configuring the Community Name on page 169](#)
- [Configuring the Security Names on page 169](#)
- [Configuring the Tag on page 169](#)

Configuring the Community Name

The community name defines the SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2c clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (read, write, or notify) allowed on those objects.

To configure the SNMP community name, include the **community-name** statement at the **[edit snmp v3 snmp-community community-index]** hierarchy level:

```
[edit snmp v3 snmp-community community-index]
community-name community-name;
```

community-name is the community string for an SNMPv1 or SNMPv2c community.

If unconfigured, it is the same as the community index.

If the community name contains spaces, enclose it in quotation marks (" ").

NOTE: Community names must be unique. You cannot configure the same community name at the **[edit snmp community]** and **[edit snmp v3 snmp-community community-index]** hierarchy levels. The configured community name at the **[edit snmp v3 snmp-community community-index]** hierarchy level is encrypted. You cannot view the community name after you have configured it and committed your changes. In the command-line interface (CLI), the community name is concealed.

Configuring the Security Names

To assign a community string to a security name, include the **security-name** statement at the **[edit snmp v3 snmp-community community-index]** hierarchy level:

```
[edit snmp v3 snmp-community community-index]
security-name security-name;
```

security-name is used when access control is set up. The **security-to-group** configuration at the **[edit snmp v3 vacm]** hierarchy level identifies the group.

NOTE: This security name must match the security name configured at the **[edit snmp v3 target-parameters target-parameters-name parameters]** hierarchy level when you configure traps.

Configuring the Tag

To configure the tag, include the **tag** statement at the **[edit snmp v3 snmp-community community-index]** hierarchy level:

```
[edit snmp v3 snmp-community community-index]
tag tag-name;
```

tag-name identifies the address of managers that are allowed to use a community string.

- [Example: SNMPv3 Community Configuration on page 170](#)

Example: SNMPv3 Community Configuration

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Define an SNMP community:

```
[edit snmp v3]
snmp-community index1 {
  community-name "$9$JOzi.QF/AtOz3"; # SECRET-DATA
  security-name john;
  tag router1; # Identifies managers that are allowed to use
               # a community string
  target-address ta1 {
    address 10.1.1.1;
    address-mask 255.255.255.0; # Defines the range of addresses
    port 162;
    tag-list router1;
    target-parameters tp1; # Applies configured target parameters
  }
}
```

CHAPTER 14

Inform Notifications

- [Configuring the Inform Notification Type and Target Address on page 171](#)
- [Example: Configuring the Inform Notification Type and Target Address on page 172](#)

Configuring the Inform Notification Type and Target Address

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

To configure the inform notification type and target information, include the following statements at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
notify name {
  tag tag-name;
  type (trap | inform);
}
target-address target-address-name {
  address address;
  address-mask address-mask;
  logical-system logical-system;
  port port-number;
  retry-count number;
  routing-instance instance;
  tag-list tag-list;
  target-parameters target-parameters-name;
  timeout seconds;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

notify *name* is the name assigned to the notification. Each notify entry name must be unique.

tag *tag-name* defines the target addresses that are sent this notification. The notification is sent to all target addresses that have this tag in their tag list. The **tag-name** is not

included in the notification. For information about how to configure the tag list, see [“Configuring the Trap Target Address” on page 149](#).

type inform is the type of notification.

target-address *target-address-name* identifies the target address. The target address defines a management application's address and parameters that are used to respond to informs.

timeout *seconds* is the number of seconds to wait for an acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted. The default timeout is **15** seconds.

retry-count *number* is the maximum number of times an inform is transmitted if no acknowledgment is received. The default is **3**. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded.

message-processing-model defines which version of SNMP to use when SNMP notifications are generated. Informs require a **v3** message processing model.

security-model defines the security model to use when SNMP notifications are generated. Informs require a **usm** security model.

security-level specifies whether the inform is authenticated and encrypted before it is sent. For the **usm** security model, the security level must be one of the following:

- **authentication**—Provides authentication but no encryption.
- **privacy**—Provides authentication and encryption.

security-name identifies the username that is used when generating the inform.

Understanding RMON Alarms and Events Configuration

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

Junos OS supports monitoring routers from remote devices. These values are measured against thresholds and trigger events when the thresholds are crossed. You configure remote monitoring (RMON) alarm and event entries to monitor the value of a MIB object.

To configure RMON alarm and event entries, you include statements at the **[edit snmp]** hierarchy level of the configuration:

```
[edit snmp]
rmon {
  alarm index {
    description text-description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    rising-event-index index;
    rising-threshold integer;
    request-type (get-next-request | get-request | walk-request);
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
    event index {
      community community-name;
      description description;
      type type;
    }
  }
}
```

```
    }  
  }  
}
```

Configuring an Alarm Entry and Its Attributes

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

An alarm entry monitors the value of a MIB variable. You can configure how often the value is sampled, the type of sampling to perform, and what event to trigger if a threshold is crossed.

This section discusses the following topics:

- [Configuring the Alarm Entry on page 178](#)
- [Configuring the Description on page 179](#)
- [Configuring the Falling Event Index or Rising Event Index on page 179](#)
- [Configuring the Falling Threshold or Rising Threshold on page 179](#)
- [Configuring the Interval on page 180](#)
- [Configuring the Falling Threshold Interval on page 180](#)
- [Configuring the Request Type on page 180](#)
- [Configuring the Sample Type on page 181](#)
- [Configuring the Startup Alarm on page 181](#)
- [Configuring the System Log Tag on page 181](#)
- [Configuring the Variable on page 182](#)

Configuring the Alarm Entry

An alarm entry monitors the value of a MIB variable. The **rising-event-index**, **rising-threshold**, **sample-type**, and **variable** statements are mandatory. All other statements are optional.

To configure the alarm entry, include the **alarm** statement and specify an index at the **[edit snmp rmon]** hierarchy level:

```
[edit snmp rmon]  
alarm index {  
  description description;  
  falling-event-index index;  
  falling-threshold integer;  
  falling-threshold-interval seconds;  
  interval seconds;
```

```

    rising-event-index index;
    rising-threshold integer;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising alarm | rising-or-falling-alarm);
    variable oid-variable;
}

```

index is an integer that identifies an alarm or event entry.

Configuring the Description

The description is a text string that identifies the alarm entry.

To configure the description, include the **description** statement and a description of the alarm entry at the **[edit snmp rmon alarm *index*]** hierarchy level:

```

[edit snmp rmon alarm index]
description description;

```

Configuring the Falling Event Index or Rising Event Index

The falling event index identifies the event entry that is triggered when a falling threshold is crossed. The rising event index identifies the event entry that is triggered when a rising threshold is crossed.

To configure the falling event index or rising event index, include the **falling-event-index** or **rising-event-index** statement and specify an index at the **[edit snmp rmon alarm *index*]** hierarchy level:

```

[edit snmp rmon alarm index]
falling-event-index index;
rising-event-index index;

```

index can be from 0 through 65,535. The default for both the falling and rising event index is 0.

Configuring the Falling Threshold or Rising Threshold

The falling threshold is the lower threshold for the monitored variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold, and the associated startup alarm is equal to **falling-alarm** or **rising-or-falling-alarm**. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising threshold. You must specify the falling threshold as an integer. Its default is 20 percent less than the rising threshold.

By default, the rising threshold is 0. The rising threshold is the upper threshold for the monitored variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold, and the associated **startup-alarm** is equal to **rising-alarm** or **rising-or-falling-alarm**. After a rising event is generated, another

rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold. You must specify the rising threshold as an integer.

To configure the falling threshold or rising threshold, include the **falling-threshold** or **rising-threshold** statement at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
falling-threshold integer;
rising-threshold integer;
```

integer can be a value from -2,147,483,647 through 2,147,483,647.

Configuring the Interval

The interval represents the period of time, in seconds, over which the monitored variable is sampled and compared with the rising and falling thresholds.

To configure the interval, include the **interval** statement and specify the number of seconds at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
interval seconds;
```

seconds can be a value from 1 through 2,147,483,647. The default is 60 seconds.

Configuring the Falling Threshold Interval

The falling threshold interval represents the interval between samples when the rising threshold is crossed. Once the alarm crosses the falling threshold, the regular sampling interval is used.

NOTE: You cannot configure the falling threshold interval for alarms that have the request type set to **walk-request**.

To configure the falling threshold interval, include the **falling-threshold-interval** statement at the **[edit snmp rmon alarm index]** hierarchy level and specify the number of seconds:

```
[edit snmp rmon alarm index]
falling-threshold-interval seconds;
```

seconds can be a value from 1 through 2,147,483,647. The default is 60 seconds.

Configuring the Request Type

By default an RMON alarm can monitor only one object instance (as specified in the configuration). You can configure a **request-type** statement to extend the scope of the RMON alarm to include all object instances belonging to a MIB branch or to include the next object instance after the instance specified in the configuration.

To configure the request type, include the **request-type** statement at the **[edit snmp rmon alarm index]** hierarchy level and specify **get-next-request**, **get-request**, or **walk-request**:

```
[edit snmp rmon alarm index]
request-type (get-next-request | get-request | walk-request);
```

walk extends the RMON alarm configuration to all object instances belonging to a MIB branch. **next** extends the RMON alarm configuration to include the next object instance after the instance specified in the configuration.

Configuring the Sample Type

The sample type identifies the method of sampling the selected variable and calculating the value to be compared against the thresholds. If the value of this object is **absolute-value**, the value of the selected variable is compared directly with the thresholds at the end of the sampling interval. If the value of this object is **delta-value**, the value of the selected variable at the last sample is subtracted from the current value, and the difference is compared with the thresholds.

To configure the sample type, include the **sample-type** statement and specify the type of sample at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
sample-type (absolute-value | delta-value);
```

- **absolute-value**—Actual value of the selected variable is compared against the thresholds.
- **delta-value**—Difference between samples of the selected variable is compared against the thresholds.

Configuring the Startup Alarm

The startup alarm identifies the type of alarm that can be sent when this entry is first activated. You can specify it as **falling-alarm**, **rising-alarm**, or **rising-or-falling-alarm**.

To configure the startup alarm, include the **startup-alarm** statement and specify the type of alarm at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);
```

- **falling-alarm**—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold.
- **rising-alarm**—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold.
- **rising-or-falling-alarm**—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds.

The default is **rising-or-falling-alarm**.

Configuring the System Log Tag

The **syslog-subtag** statement specifies the tag to be added to the system log message. You can specify a string of not more than 80 uppercase characters as the system log tag.

To configure the system log tag, include the **syslog-subtag** statement at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
syslog-subtag syslog-subtag;
```

Configuring the Variable

The variable identifies the MIB object that is being monitored.

To configure the variable, include the **variable** statement and specify the object identifier or object name at the **[edit snmp rmon alarm index]** hierarchy level:

```
[edit snmp rmon alarm index]
variable oid-variable;
```

oid-variable is a dotted decimal (for example, 1.3.6.1.2.1.2.1.2.1.10.1) or MIB object name (for example, **ifInOctets.1**).

Configuring an Event Entry and Its Attributes

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

An event entry generates a notification for an alarm entry when its rising or falling threshold is crossed. You can configure the type of notification that is generated. To configure the event entry, include the **event** statement at the **[edit snmp rmon]** hierarchy level. All statements except the **event** statement are optional.

```
[edit snmp rmon]
event index {
  community community-name;
  description description;
  type type;
}
```

index identifies an entry event.

community-name is the trap group that is used when generating a trap. If that trap group has the **rmon-alarm** trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group. If nothing is configured, all the trap groups are examined, and traps are sent using each group with the **rmon-alarm** category set.

description is a text string that identifies the entry.

The **type** variable of an event entry specifies where the event is to be logged. You can specify the type as one of the following:

- **log**—Adds the event entry to the **logTable**.
- **log-and-trap**—Sends an SNMP trap and creates a log entry.
- **none**—Sends no notification.
- **snmptrap**—Sends an SNMP trap.

The default for the event entry type is **log-and-trap**.

Example: Configuring an RMON Alarm and Event Entry

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

Configure an RMON alarm and event entry:

```
[edit snmp]
rmon {
  alarm 100 {
    description "input traffic on fxp0";
    falling-event-index 100;
    falling-threshold 10000;
    interval 60;
    rising-event-index 100;
    rising-threshold 100000;
    sample-type delta-value;
    startup-alarm rising-or-falling-alarm;
    variable ifInOctets.1;
  }
  event 100 {
    community bedrock;
    description "emergency events";
    type log-and-trap;
  }
}
```

Configuring Health Monitoring on Devices Running Junos OS

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

As the number of devices managed by a typical network management system (NMS) grows and the complexity of the devices themselves increases, it becomes increasingly impractical for the NMS to use polling to monitor the devices. A more scalable approach is to rely on network devices to notify the NMS when something requires attention.

On Juniper Networks routers, RMON alarms and events provide much of the infrastructure needed to reduce the polling overhead from the NMS. However, with this approach, you must set up the NMS to configure specific MIB objects into RMON alarms. This often

requires device-specific expertise and customizing of the monitoring application. In addition, some MIB object instances that need monitoring are set only at initialization or change at runtime and cannot be configured in advance.

To address these issues, the health monitor extends the RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (for file system usage, CPU usage, and memory usage) and includes support for unknown or dynamic object instances (such as Junos OS processes).

Health monitoring is designed to minimize user configuration requirements. To configure health monitoring entries, include the **health-monitor** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
health-monitor {
  falling-threshold percentage;
  interval seconds;
  rising-threshold percentage;
}
```

You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

This topic describes the minimum required configuration and discusses the following tasks for configuring the health monitor:

- [Monitored Objects on page 184](#)
- [Minimum Health Monitoring Configuration on page 185](#)
- [Configuring the Falling Threshold or Rising Threshold on page 185](#)
- [Configuring the Interval on page 186](#)
- [Log Entries and Traps on page 186](#)

Monitored Objects

When you configure the health monitor, monitoring information for certain object instances is available, as shown in [Table 17 on page 184](#).

Table 17: Monitored Object Instances

Object	Description
<code>jnxHrStoragePercentUsed.1</code>	Monitors the following file system on the router or switch: <code>/dev/ad0s1a:</code> This is the root file system mounted on <code>/</code> .
<code>jnxHrStoragePercentUsed.2</code>	Monitors the following file system on the router or switch: <code>/dev/ad0s1e:</code> This is the configuration file system mounted on <code>/config</code> .

Table 17: Monitored Object Instances (*continued*)

Object	Description
<code>jnxOperatingCPU (RE0)</code>	Monitors CPU usage for Routing Engines (RE0 and RE1). The index values assigned to Routing Engines depend on whether the Chassis MIB uses a zero-based or ones-based indexing scheme. Because the indexing scheme is configurable, the proper index is determined when the router or switch is initialized and when there is a configuration change. If the router or switch has only one Routing Engine, the alarm entry monitoring RE1 is removed after five failed attempts to obtain the CPU value.
<code>jnxOperatingCPU (RE1)</code>	
<code>jnxOperatingBuffer (RE0)</code>	Monitors the amount of memory available on Routing Engines (RE0 and RE1). Because the indexing of this object is identical to that used for <code>jnxOperatingCPU</code> , index values are adjusted depending on the indexing scheme used in the Chassis MIB. As with <code>jnxOperatingCPU</code> , the alarm entry monitoring RE1 is removed if the router or switch has only one Routing Engine.
<code>jnxOperatingBuffer (RE1)</code>	
<code>sysApplElmtRunCPU</code>	Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately.
<code>sysApplElmtRunMemory</code>	Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.

Minimum Health Monitoring Configuration

To enable health monitoring on the router or switch, include the **health-monitor** statement at the `[edit snmp]` hierarchy level:

```
[edit snmp]
health-monitor;
```

Configuring the Falling Threshold or Rising Threshold

The falling threshold is the lower threshold (expressed as a percentage of the maximum possible value) for the monitored variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising threshold. You must specify the falling threshold as a percentage of the maximum possible value. The default is **70** percent.

By default, the rising threshold is **80** percent of the maximum possible value for the monitored object instance. The rising threshold is the upper threshold for the monitored variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold. After a rising event is generated, another

rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold. You must specify the rising threshold as a percentage of the maximum possible value for the monitored variable.

To configure the falling threshold or rising threshold, include the **falling-threshold** or **rising-threshold** statement at the **[edit snmp health-monitor]** hierarchy level:

```
[edit snmp health-monitor]
  falling-threshold percentage;
  rising-threshold percentage;
```

percentage can be a value from 1 through 100.

The falling and rising thresholds apply to all object instances monitored by the health monitor.

Configuring the Interval

The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

To configure the interval, include the **interval** statement and specify the number of seconds at the **[edit snmp health-monitor]** hierarchy level:

```
[edit snmp health-monitor]
  interval seconds;
```

seconds can be a value from 1 through 2147483647. The default is 300 seconds (5 minutes).

Log Entries and Traps

The system log entries generated for any health monitor events (thresholds crossed, errors, and so on) have a corresponding **HEALTHMONITOR** tag rather than a generic **SNMPD_RMON_EVENTLOG** tag. However, the health monitor sends generic RMON **risingThreshold** and **fallingThreshold** traps.

Related Documentation

- [Understanding RMON Alarms and Events Configuration on page 177](#)
- [Configuring an Alarm Entry and Its Attributes on page 178](#)
- [Configuring an Event Entry and Its Attributes on page 182](#)
- [Example: Configuring Health Monitoring on page 186](#)
- [Understanding Device Management Functions in Junos OS on page 89](#)

Example: Configuring Health Monitoring

Supported Platforms **LN Series, M Series, MX Series, PTX Series, T Series**

Configure the health monitor:

```
[edit snmp]
health-monitor {
  falling-threshold 85;
```

```
interval 600;  
rising-threshold 75;  
}
```

In this example, the sampling interval is every **600** seconds (10 minutes), the falling threshold is **85** percent of the maximum possible value for each object instance monitored, and the rising threshold is **75** percent of the maximum possible value for each object instance monitored.

Configuration Statements at the [edit snmp] Hierarchy Level

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

This topic shows all possible configuration statements at the **[edit snmp]** hierarchy level and their level in the configuration hierarchy. When you are configuring Junos OS, your current hierarchy level is shown in the banner on the line preceding the **user@host#** prompt.

```
[edit]
snmp {

Complete SNMPv3 Configuration Statements

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

To configure SNMPv3, include the following statements at the **[edit snmp v3]** and **[edit snmp]** hierarchy levels:

```

[edit snmp]
engine-id {
    (local engine-id | use-mac-address | use-default-ip-address);
}
view view-name {
    oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
    tag tag-name;
    type (trap | inform);
}
notify-filter profile-name {
    oid object-identifier (include | exclude);
}
snmp-community community-index {
    community-name community-name;
    security-name security-name;
    tag tag-name;
}
target-address target-address-name {
    address address;
    address-mask address-mask;
}

```

```

logical-system logical-system;
port port-number;
retry-count number;
routing-instance instance;
tag-list tag-list;
target-parameters target-parameters-name;
timeout seconds;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
usm {
  (local-engine | remote-engine engine-id) {
    user username {
      authentication-md5 {
        authentication-password authentication-password;
      }
      authentication-none;
      authentication-sha {
        authentication-password authentication-password;
      }
      privacy-3des {
        privacy-password privacy-password;
      }
      privacy-aes128 {
        privacy-password privacy-password;
      }
      privacy-des {
        privacy-password privacy-password;
      }
      privacy-none;
    }
  }
}
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix) {
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
}
security-to-group {
  security-model (usm | v1 | v2c) {

```

```

        security-name security-name {
            group group-name;
        }
    }
}

```

access-list

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Syntax

```

[edit snmp]
routing-instance-access {
    access-list {
        routing-instance;
        routing-instance restrict;
    }
}

```

Hierarchy Level [edit snmp routing-instance-access]

Release Information Statement introduced in Junos OS Release 8.4.

Description Create access lists to control SNMP agents in routing instances from accessing SNMP information. To enable the SNMP agent on a routing instance to access SNMP information, specify the routing instance name. To disable the SNMP agent on a routing instance from accessing SNMP information, include the routing-instance name followed by the **restrict** keyword.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

address

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , T Series
Syntax	<code>address <i>address</i>;</code>
Hierarchy Level	[edit snmp v3 target-address <i>target-address-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify the SNMP target address.
Options	<i>address</i> —IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Address on page 148

address-mask

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , T Series
Syntax	<code>address-mask <i>address-mask</i>;</code>
Hierarchy Level	[edit snmp v3 target-address <i>target-address-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Verify the source addresses for a group of target addresses.
Options	<i>address-mask</i> combined with the address defines a range of addresses.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Address Mask on page 148

agent-address

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	agent-address outgoing-interface;
Hierarchy Level	[edit snmp trap-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is outgoing-interface , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.
Options	outgoing-interface —Value of the agent address of all SNMPv1 traps generated by this router or switch. The outgoing-interface option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap. Default: disabled (the agent address is not specified in SNMPv1 traps).
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Agent Address for SNMP Traps on page 140

alarm

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	<pre>alarm <i>index</i> { <i>description</i> <i>description</i>; falling-event-index <i>index</i>; falling-threshold <i>integer</i>; falling-threshold-interval <i>seconds</i>; interval <i>seconds</i>; request-type (get-next-request get-request walk-request); rising-event-index <i>index</i>; rising-threshold <i>integer</i>; sample-type (absolute-value delta-value); startup-alarm (falling-alarm rising-alarm rising-or-falling alarm); syslog-subtag <i>syslog-subtag</i>; variable <i>oid-variable</i>; }</pre>
Hierarchy Level	[edit snmp rmon]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure RMON alarm entries.
Options	<i>index</i> —Identifies this alarm entry as an integer. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring an Alarm Entry and Its Attributes on page 178 • event on page 216

authentication-md5

Supported Platforms	LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<pre>authentication-md5 { authentication-password authentication-password; }</pre>
Hierarchy Level	<pre>[edit snmp v3 usm local-engine user username], [edit snmp v3 usm remote-engine engine-id user username]</pre>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure MD5 as the authentication type for the SNMPv3 user.

NOTE: You can only configure one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring MD5 Authentication on page 129

authentication-none

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [QFX Series](#), [T Series](#)

Syntax authentication-none;

Hierarchy Level [edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure that there should be no authentication for the SNMPv3 user.

NOTE: You can configure only one authentication type for each SNMPv3 user.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation • [Configuring No Authentication on page 129](#)

authentication-password

Supported Platforms	LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	authentication-password <i>authentication-password</i> ;
Hierarchy Level	[edit snmp v3 usm local-engine user <i>username</i> authentication-md5], [edit snmp v3 usm local-engine user <i>username</i> authentication-sha], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> authentication-md5], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> authentication-sha]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the password for user authentication.
Options	<i>authentication-password</i>—Password that a user enters. The password is then converted into a key that is used for authentication. SNMPv3 has special requirements when you create plain-text passwords on a router or switch: • The password must be at least eight characters long. • The password can include alphabetic, numeric, and special characters, but it cannot include control characters.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring MD5 Authentication on page 129 • Configuring SHA Authentication on page 129

authentication-sha

Supported Platforms	LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<pre>authentication-sha { authentication-password authentication-password; }</pre>
Hierarchy Level	[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the secure hash algorithm (SHA) as the authentication type for the SNMPv3 user.

NOTE: You can configure only one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SHA Authentication on page 129

authorization

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, SRX Series, T Series
Syntax	authorization <i>authorization</i> ;
Hierarchy Level	[edit snmp community <i>community-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Set the access authorization for SNMP Get , GetBulk , GetNext , and Set requests.
Options	<i>authorization</i>—Access authorization level: read-only—Enable Get, GetNext, and GetBulk requests. read-write—Enable all requests, including Set requests. You must configure a view to enable Set requests. Default: read-only
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	Configuring the SNMP Community String on page 165

categories

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , SRX Series , T Series
Syntax	<pre>categories { category; }</pre>
Hierarchy Level	[edit snmp trap-group <i>group-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define the types of traps that are sent to the targets of the named trap group.
Default	If you omit the categories statement, all trap types are included in trap notifications.
Options	category —Name of a trap type: authentication , chassis , configuration , link , remote-operations , rmon-alarm , routing , sonet-alarms , startup , or vrrp-events .
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Trap Groups on page 141

client-list

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , SRX Series , T Series
Syntax	<pre>client-list <i>client-list-name</i> { ip-addresses; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for QFX Series switches.
Description	Define a list of SNMP clients.
Options	client-list-name —Name of the client list. ip-addresses —IP addresses of the SNMP clients to be added to the client list,
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Adding a Group of Clients to an SNMP Community on page 167

client-list-name

Supported Platforms [EX Series](#), [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Syntax `client-list-name client-list-name;`

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for FX Series switches.

Description Add a client list or prefix list to an SNMP community.

Options *client-list-name*—Name of the client list or prefix list.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- [Adding a Group of Clients to an SNMP Community on page 167](#)

clients

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	<pre>clients { address <restrict>; }</pre>
Hierarchy Level	[edit snmp community <i>community-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for FX Series switches.
Description	Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.
Default	If you omit the clients statement, all SNMP clients using this community string are authorized to access the router.
Options	address —Address of an SNMP client that is authorized to access this router. You must specify an address, not a hostname. To specify more than one client, include multiple address options. restrict —(Optional) Do not allow the specified SNMP client to access the router.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the SNMP Community String on page 165

commit-delay

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, SRX Series, T Series
Syntax	commit-delay <i>seconds</i> ;
Hierarchy Level	[edit snmp nonvolatile]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure the timer for the SNMP Set reply and start of the commit.
Options	seconds —Delay between an affirmative SNMP Set reply and start of the commit. Default: 5 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Commit Delay Timer on page 114

community

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	<pre>community <i>community-name</i> { authorization <i>authorization</i>; client-list-name <i>client-list-name</i>; clients { address restrict; } view <i>view-name</i>; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects. The SNMP client application specifies an SNMP community name in Get, GetBulk, GetNext, and Set SNMP requests.
Default	If you omit the community statement, all SNMP requests are denied.
Options	community-name—Community string. If the name includes spaces, enclose it in quotation marks (" "). The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the SNMP Community String on page 165

community

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	community <i>community-name</i> ;
Hierarchy Level	[edit snmp rmon event <i>index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The trap group that is used when generating a trap (if eventType is configured to send traps). If that trap group has the rmon-alarm trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of eventCommunity). If nothing is configured, traps are sent to each group with the rmon-alarm category set.
Options	community-name —Identifies the trap group that is used when generating a trap if the event is configured to send traps.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring an Event Entry and Its Attributes on page 182

community-name

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	community-name <i>community-name</i> ;
Hierarchy Level	[edit snmp v3 snmp-community <i>community-index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The community name defines an SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2 clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (notify, read, or write) allowed on those objects.
Options	<i>community-name</i> —Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose it in quotation marks (" ").

NOTE: Community names must be unique. You cannot configure the same community name at the [edit snmp community] and [edit snmp v3 snmp-community *community-index*] hierarchy levels.

The community name at the [edit snmp v3 snmp-community *community-index*] hierarchy level is encrypted and not displayed in the command-line interface (CLI).

Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the SNMPv3 Community on page 168

contact

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	contact <i>contact</i> ;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define the value of the MIB II sysContact object, which is the contact person for the managed system.
Options	contact —Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the System Contact on a Device Running Junos OS on page 112

description

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, SRX Series, T Series
Syntax	description <i>description</i> ;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Define the value of the MIB II sysDescription object, which is the description of the system being managed.
Options	description —System description. If the name includes spaces, enclose it in quotation marks (" ").
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the System Description on a Device Running Junos OS on page 112

description

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	<code>description</code> <i>description</i> ;
Hierarchy Level	[edit snmp rmon alarm <i>index</i>], [edit snmp rmon event <i>index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Text description of alarm or event.
Options	<i>description</i> —Text description of an alarm or event entry. If the description includes spaces, enclose it in quotation marks (" ").
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Description on page 179 • Configuring an Event Entry and Its Attributes on page 182

destination-port

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	<code>destination-port</code> <i>port-number</i> ;
Hierarchy Level	[edit snmp trap-group]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Assign a trap port number other than the default.
Default	If you omit this statement, the default port is 162.
Options	<i>port-number</i> —SNMP trap port number.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Trap Groups on page 141

engine-id

Supported Platforms [EX Series](#), [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

Syntax engine-id {
 (local *engine-id-suffix* | use-default-ip-address | use-mac-address);
 }

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 9.1 for EX Series switches.

Description The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*. You can configure the suffix here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID.

For the engine ID, we recommend using the MAC address of the management port.

Options local *engine-id-suffix*—Explicit setting for the engine ID suffix.

use-default-ip-address—The engine ID suffix is generated from the default IP address.

use-mac-address—The SNMP engine identifier is generated from the MAC address of the management interface on the router.

Default: use-default-ip-address

Required Privilege Level snmp—To view this statement in the configuration.
 snmp-control—To add this statement to the configuration.

enterprise-oid

Supported Platforms	LN Series , M Series , MX Series , PTX Series , SRX Series , T Series
Syntax	enterprise-oid;
Hierarchy Level	[edit snmp trap-options]
Release Information	Statement introduced in Junos OS Release 10.0
Description	Add the snmpTrapEnterprise object, which shows the association between an enterprise-specific trap and the organization that defined the trap, to standard SNMP traps. By default, the snmpTrapEnterprise object is added only to the enterprise-specific traps. When the enterprise-oid statement is included in the configuration, snmpTrapEnterprise is added to all the traps generated from the device.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Trap Options on page 137

event

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , T Series
Syntax	event <i>index</i> { community <i>community-name</i> ; description <i>description</i> ; type <i>type</i> ; }
Hierarchy Level	[edit snmp rmon]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure RMON event entries.
Options	<i>index</i> —Identifier for a specific event entry. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring an Event Entry and Its Attributes on page 182 • alarm on page 200

falling-event-index

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	falling-event-index <i>index</i> ;
Hierarchy Level	[edit snmp rmon <i>alarm index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The index of the event entry that is used when a falling threshold is crossed. If this value is zero, no event is triggered.
Options	<i>index</i> —Index of the event entry that is used when a falling threshold is crossed. Range: 0 through 65,535 Default: 0
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Falling Event Index or Rising Event Index on page 179 • rising-event-index on page 245

falling-threshold

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	falling-threshold <i>percentage</i> ;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The lower threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising-threshold .
Options	<i>percentage</i> —The lower threshold for the alarm entry. Range: 1 through 100 Default: 70 percent of the maximum possible value
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Falling Threshold or Rising Threshold on page 185 • rising-threshold on page 247

falling-threshold

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	falling-threshold <i>integer</i> ;
Hierarchy Level	[edit snmp rmon <i>alarm index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The lower threshold for the sampled variable. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval is greater than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is less than or equal to this threshold, and the associated startup-alarm value is equal to falling-alarm value or rising-or-falling-alarm value. After a falling event is generated, another falling event cannot be generated until the sampled value rises above this threshold and reaches the rising-threshold .
Options	<i>integer</i> —The lower threshold for the alarm entry. Range: -2,147,483,648 through 2,147,483,647 Default: 20 percent less than rising-threshold
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Falling Threshold or Rising Threshold on page 179 • rising-threshold on page 246

falling-threshold-interval

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	falling-threshold-interval <i>seconds</i> ;
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Interval between samples when the rising threshold is crossed. Once the alarm crosses the falling threshold, the regular sampling interval is used.
Options	seconds —Time between samples, in seconds. Range: 1 through 2,147,483,647 seconds Default: 60 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Falling Threshold Interval on page 180 • interval on page 224

filter-duplicates

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	filter-duplicates;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Filter duplicate Get , GetNext , or GetBulk SNMP requests.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Filtering Duplicate SNMP Requests on page 116

filter-interfaces

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	<pre>filter-interfaces { interfaces { all-internal-interfaces; interface 1; interface 2; } }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.4 for EX Series Switches.
Description	Filter out information related to specific interfaces from the output of SNMP Get and GetNext requests performed on interface-related MIBs.
Options	all-internal-interfaces—Filters out information from SNMP Get and GetNext requests for the specified interfaces. interfaces—Specifies the interfaces to filter out from the output of SNMP Get and GetNext requests.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Filtering Interface Information Out of SNMP Get and GetNext Output on page 118

group (Configuring Group Name)

Supported Platforms [EX Series](#), [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

Syntax

```
group group-name {  
  (default-context-prefix | context-prefix context-prefix){  
    security-model (any | usm | v1 | v2c) {  
      security-level (authentication | none | privacy) {  
        notify-view view-name;  
        read-view view-name;  
        write-view view-name;  
      }  
    }  
  }  
}
```

Hierarchy Level [edit snmp v3 vacm access]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix context-prefix** statement enables you to specify a context and to add that particular context to the group. When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group.

The remaining statements under this hierarchy are documented in separate topics.

Options *group-name*—SNMPv3 group name created for the SNMPv3 group.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- [Configuring the Group on page 156](#)

group (Defining Access Privileges for an SNMPv3 Group)

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	<code>group group-name;</code>
Hierarchy Level	[edit snmp v3 vacm security-to-group security-model (usm v1 v2c) <code>security-name security-name</code>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define access privileges granted to a group.
Options	<i>group-name</i> —Identifies a collection of SNMP security names that belong to the same access policy SNMP.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Group on page 133

health-monitor

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	<pre>health-monitor { falling-threshold percentage; interval seconds; rising-threshold percentage; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure health monitoring. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring Health Monitoring on Devices Running Junos OS on page 183

interface

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , QFX Series , SRX Series , T Series
Syntax	interface [<i>interface-names</i>];
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the interfaces on which SNMP requests can be accepted.
Default	If you omit this statement, SNMP requests entering the router or switch through any interface are accepted.
Options	<i>interface-names</i> —Names of one or more logical interfaces.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 117

interval

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , T Series
Syntax	interval <i>seconds</i> ;
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Interval between samples.
Options	<i>seconds</i> —Time between samples, in seconds. Range: 1 through 2,147,483,647 seconds Default: 60 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Interval on page 180

interval

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	interval <i>seconds</i> ;
Hierarchy Level	[edit snmp health-monitor]
Release Information	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Interval between samples.
Options	<i>seconds</i> —Time between samples, in seconds. Range: 1 through 2147483647 seconds Default: 300 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Interval on page 186

local-engine

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [T Series](#)

Syntax

```
local-engine {  
  user username {  
    authentication-md5 {  
      authentication-password authentication-password;  
    }  
    authentication-none;  
    authentication-sha {  
      authentication-password authentication-password;  
    }  
    privacy-aes128 {  
      privacy-password privacy-password;  
    }  
    privacy-des {  
      privacy-password privacy-password;  
    }  
    privacy-3des {  
      privacy-password privacy-password;  
    }  
    privacy-none {  
      privacy-password privacy-password;  
    }  
  }  
}
```

Hierarchy Level [edit snmp v3 [usm](#)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure local engine information for the user-based security model (USM).

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- [Creating SNMPv3 Users on page 123](#)

location

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , SRX Series , T Series
Syntax	location <i>location</i> ;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define the value of the MIB II sysLocation object, which is the physical location of the managed system.
Options	<i>location</i> —Location of the local system. You must enclose the name within quotation marks (" ").
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the System Location for a Device Running Junos OS on page 113

logical-system

Supported Platforms [EX Series](#), [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Syntax `logical-system logical-system-name {
 routing-instance routing-instance-name;
}`

Hierarchy Level `[edit snmp community community-name],
[edit snmp trap-group],
[edit snmp trap-options]
[edit snmp v3target-address target-address-name]`

Release Information Statement introduced in Junos OS Release 9.3
Statement introduced in Junos OS Release 9.0 for EX Series switches.

NOTE: The `logical-system` statement replaces the `logical-router` statement, and is backward-compatible with Junos OS Release 8.3 and later.

Description Specify a logical system name for SNMP v1 and v2c clients.

Include at the `[edit snmp trap-options]` hierarchy level to specify a logical-system address as the source address of an SNMP trap.

Include at the `[edit snmp v3 target-address]` hierarchy level to specify a logical-system name as the destination address for an SNMPv3 trap or inform.

Options `logical-system-name`—Name of the logical system.

`routing-instance routing-instance-name`—Statement to specify a routing instance associated with the logical system.

Required Privilege Level `snmp`—To view this statement in the configuration.
`snmp-control`—To add this statement to the configuration.

Related Documentation

logical-system-trap-filter

Supported Platforms	LN Series , M Series , MX Series , PTX Series , SRX Series , T Series
Syntax	logical-system-trap-filter;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	Restrict the routing instances from receiving traps that are not related to the logical system networks to which they belong.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Trap Support for Routing Instances on page 87

message-processing-model

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , QFX Series , T Series
Syntax	message-processing-model (v1 v2c v3);
Hierarchy Level	[edit snmp v3 target-parameters <i>target-parameter-name</i> parameters]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the message processing model to be used when generating SNMP notifications.
Options	v1—SNMPv1 message process model. v2c—SNMPv2c message process model. v3—SNMPv3 message process model.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Message Processing Model on page 151

name

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , SRX Series , T Series
Syntax	name <i>name</i> ;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the system name from the command-line interface.
Options	<i>name</i> —System name override.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the System Name on page 113

nonvolatile

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , SRX Series , T Series
Syntax	nonvolatile { commit-delay <i>seconds</i> ; }
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. The commit-delay statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure options for SNMP Set requests. The statement is explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Commit Delay Timer on page 114 • commit-delay on page 209

notify

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<pre> notify <i>name</i> { tag <i>tag-name</i>; type (trap inform); } </pre>
Hierarchy Level	[edit snmp v3]
Release Information	Statement introduced before Junos OS Release 7.4. type inform option added in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Select management targets for SNMPv3 notifications as well as the type of notifications. Notifications can be either traps or informs.
Options	<i>name</i>—Name assigned to the notification. <i>tag-name</i>—Notifications are sent to all targets configured with this tag. <i>type</i>—Notification type is trap or inform. Traps are unconfirmed notifications. Informs are confirmed notifications.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Inform Notification Type and Target Address on page 171 • Configuring the SNMPv3 Trap Notification on page 146

notify-filter (Applying to the Management Target)

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	notify-filter <i>profile-name</i> ;
Hierarchy Level	[edit snmp v3 target-parameters <i>target-parameters-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify the notify filter to be used by a specific set of target parameters.
Options	<i>profile-name</i> —Name of the notify filter to apply to notifications.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Applying the Trap Notification Filter on page 151

notify-filter (Configuring the Profile Name)

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	notify-filter <i>profile-name</i> { oid <i>oid</i> (include exclude); }
Hierarchy Level	[edit snmp v3]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify a group of MIB objects for which you define access. The notify filter limits the type of traps or informs sent to the network management system.
Options	<i>profile-name</i> —Name assigned to the notify filter. The remaining statement is explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Trap Notification Filter on page 141 • oid on page 235

notify-view

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	notify-view <i>view-name</i> ;
Hierarchy Level	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix context-prefix <i>context-prefix</i>) security-model (any usm v1 v2c) security-level (authentication none privacy)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Associate the notify view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
Options	<i>view-name</i> —Name of the view to which the SNMP user group has access.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring MIB Views on page 118 • Configuring the Notify View on page 158

oid

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	oid <i>object-identifier</i> (exclude include);
Hierarchy Level	[edit snmp view <i>view-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify an object identifier (OID) used to represent a subtree of MIB objects.
Options	exclude —Exclude the subtree of MIB objects represented by the specified OID. include —Include the subtree of MIB objects represented by the specified OID. <i>object-identifier</i> —OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring MIB Views on page 118

oid

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	oid <i>oid</i> (include exclude);
Hierarchy Level	[edit snmp v3 notify-filter <i>profile-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify an object identifier (OID) used to represent a subtree of MIB objects. This OID is a prefix that the represented MIB objects have in common.
Options	exclude —Exclude the subtree of MIB objects represented by the specified OID. include —Include the subtree of MIB objects represented by the specified OID. oid —Object identifier used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Trap Notification Filter on page 141

parameters

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<pre>parameters { message-processing-model (v1 v2c v3); security-level (none authentication privacy); security-model (usm v1 v2c); security-name security-name; }</pre>
Hierarchy Level	[edit snmp v3 target-parameters <i>target-parameters-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure a set of target parameters for message processing and security. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Defining and Configuring the Trap Target Parameters on page 150

port

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<pre>port port-number;</pre>
Hierarchy Level	[edit snmp v3 target-address <i>target-address-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure a UDP port number for an SNMP target.
Default	If you omit this statement, the default port is 162.
Options	<i>port-number</i> —Port number for the SNMP target.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Port on page 149

privacy-3des

Supported Platforms	LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<pre>privacy-3des { privacy-password <i>privacy-password</i>; }</pre>
Hierarchy Level	<pre>[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]</pre>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the triple Data Encryption Standard (3DES) as the privacy type for the SNMPv3 user.
Options	privacy-password <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption. SNMPv3 has special requirements when you create plain-text passwords on a router or switch: • The password must be at least eight characters long. • The password can include alphabetic, numeric, and special characters, but it cannot include control characters.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Encryption Type on page 130

privacy-aes128

Supported Platforms	LN Series , M Series , MX Series , PTX Series , QFX Series , T Series
Syntax	<pre>privacy-aes128 { privacy-password <i>privacy-password</i>; }</pre>
Hierarchy Level	[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the Advanced Encryption Standard encryption algorithm (CFB128-AES-128 Privacy Protocol) for the SNMPv3 user.
Options	<code>privacy-password</code> <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption. SNMPv3 has special requirements when you create plain-text passwords on a router or switch: • The password must be at least eight characters long. • The password can include alphabetic, numeric, and special characters, but it cannot include control characters.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Encryption Type on page 130

privacy-des

Supported Platforms	LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<pre>privacy-des { privacy-password <i>privacy-password</i>; }</pre>
Hierarchy Level	<pre>[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]</pre>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the Data Encryption Standard (DES) as the privacy type for the SNMPv3 user.
Options	privacy-password <i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption. SNMPv3 has special requirements when you create plain-text passwords on a router or switch: • The password must be at least eight characters long. • The password can include alphabetic, numeric, and special characters, but it cannot include control characters.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Encryption Type on page 130

privacy-none

Supported Platforms	LN Series , M Series , MX Series , PTX Series , QFX Series , T Series
Syntax	privacy-none;
Hierarchy Level	[edit snmp v3 usm local-engine user <i>username</i>], [edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure that no encryption be used for the SNMPv3 user.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Encryption Type on page 130

privacy-password

Supported Platforms	LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<code>privacy-password <i>privacy-password</i>;</code>
Hierarchy Level	<code>[edit snmp v3 usm local-engine user <i>username</i> privacy-3des],</code> <code>[edit snmp v3 usm local-engine user <i>username</i> privacy-aes128],</code> <code>[edit snmp v3 usm local-engine user <i>username</i> privacy-des],</code> <code>[edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-3des],</code> <code>[edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-aes128],</code> <code>[edit snmp v3 usm remote-engine <i>engine-id</i> user <i>username</i> privacy-des]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure a privacy password for the SNMPv3 user.
Options	<i>privacy-password</i>—Password that a user enters. The password is then converted into a key that is used for encryption. SNMPv3 has special requirements when you create plain-text passwords on a router or switch: • The password must be at least eight characters long. • The password can include alphabetic, numeric, and special characters, but it cannot include control characters.
Required Privilege Level	<code>snmp</code>—To view this statement in the configuration. <code>snmp-control</code>—To add this statement to the configuration.
Related Documentation	• Configuring the Encryption Type on page 130

read-view

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	read-view <i>view-name</i> ;
Hierarchy Level	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix context-prefix <i>context-prefix</i>) security-model (any usm v1 v2c) security-level (authentication none privacy)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Associate the read-only view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
Options	<i>view-name</i> —The name of the view to which the SNMP user group has access.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Read View on page 158 • Configuring MIB Views on page 118

remote-engine

Supported Platforms	LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<pre> remote-engine <i>engine-id</i> { user <i>username</i> { authentication-md5 { authentication-password <i>authentication-password</i>; } authentication-none; authentication-sha { authentication-password <i>authentication-password</i>; } privacy-aes128 { privacy-password <i>privacy-password</i>; } privacy-des { privacy-password <i>privacy-password</i>; } privacy-3des { privacy-password <i>privacy-password</i>; } privacy-none { privacy-password <i>privacy-password</i>; } } } </pre>
Hierarchy Level	[edit snmp v3 usm]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the remote engine information for the user-based security model (USM). To send inform messages to an SNMPv3 user on a remote device, you must configure the engine identifier for the SNMP agent on the remote device where the user resides.
Options	<i>engine-id</i>—Engine identifier. Used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Remote Engine and Remote User on page 293

request-type

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	request-type (get-next-request get-request walk-request);
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Extend monitoring to a specific SNMP object instance (get-request), or extend monitoring to all object instances belonging to a MIB branch (walk-request), or extend monitoring to the next object instance after the instance specified in the configuration (get-next-request).
Options	get-next-request —Performs an SNMP get next request. get-request —Performs an SNMP get request. walk-request —Performs an SNMP walk request. Default: walk-request
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Request Type on page 180 • variable on page 282

retry-count

Supported Platforms	LN Series
Syntax	retry-count <i>number</i> ;
Hierarchy Level	[edit snmp v3 <i>target-address</i> <i>target-address-name</i>]
Release Information	Statement introduced in Junos OS Release 7.4.
Description	Configure the retry count for SNMP informs.
Options	<i>number</i>—Maximum number of times the inform is transmitted if no acknowledgment is received. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded. Default: 3 times
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Informs on page 121 • timeout on page 269

rising-event-index

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	rising-event-index <i>index</i> ;
Hierarchy Level	[edit snmp rmon <i>alarm</i> <i>index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Index of the event entry that is used when a rising threshold is crossed. If this value is zero, no event is triggered.
Options	<i>index</i>—Index of the event entry that is used when a rising threshold is crossed. Range: 0 through 65,535 Default: 0
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Falling Event Index or Rising Event Index on page 179 • falling-event-index on page 217

rising-threshold

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	rising-threshold <i>integer</i> ;
Hierarchy Level	[edit snmp rmon <i>alarm index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Upper threshold for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold, and the associated startup alarm value is equal to the falling alarm or rising or falling alarm value. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling threshold.
Options	<i>integer</i> —The lower threshold for the alarm entry. Range: –2,147,483,648 through 2,147,483,647
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Falling Threshold or Rising Threshold on page 179 • falling-threshold on page 219

rising-threshold

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	rising-threshold <i>percentage</i> ;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The upper threshold is expressed as a percentage of the maximum possible value for the sampled variable. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval is less than this threshold, a single event is generated. A single event is also generated if the first sample after this entry becomes valid is greater than or equal to this threshold. After a rising event is generated, another rising event cannot be generated until the sampled value falls below this threshold and reaches the falling-threshold .
Options	<i>percentage</i> —The lower threshold for the alarm entry. Range: 1 through 100 Default: 80 percent of the maximum possible value
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• falling-threshold on page 218 • Configuring the Falling Threshold or Rising Threshold on page 185

rmon

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	rmon { ... }
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure Remote Monitoring.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring an Alarm Entry and Its Attributes on page 178

routing-engine (SNMP Resource Level)

Supported Platforms	LN Series, SRX100, SRX110, SRX210, SRX220, SRX240, SRX550, SRX650
Syntax	<pre> routing-engine { resource <cpu memory open-files-count process-count storage temperature> ; { interval <interval in secs>; moderate-threshold <percentage level>; high-threshold <percentage level>; critical-threshold <percentage level>; action <monitor prevent recover>; } } </pre>
Hierarchy Level	[edit snmp health-monitor routing-engine]
Release Information	Statement introduced in Junos OS Release 12.1X44-D10. Statement modified in Junos OS Release 12.1X45-D10.
Description	Override the global configuration for a resource.
Options	• interval—Monitoring interval in seconds. Default: 300 seconds • moderate-threshold—Percentage of moderate threshold level resource utilization. Default: 70 percent. • high-threshold —Percentage of high-threshold level resource utilization. Default: 80 percent. • critical-threshold —Percentage of critical threshold level resource utilization. Default: 90 percent. • action—Enable action for all resources. Default: If action is not enabled, the default action is prevent.
	 WARNING: If the system health management action for an affected resource is configured to recover, then certain intrusive operations necessary for preventing system breakdown are taken. Intrusive operations can include restarting or terminating processes, deleting files, and so on. Such action information is logged in the system health management history and system log.
Required Privilege Level	security—To view this statement in the configuration. security-control—To add this statement to the configuration.

routing-engine (SNMP Global Level)

Supported Platforms LN Series, SRX100, SRX110, SRX210, SRX220, SRX240, SRX550, SRX650

Syntax routing-engine

```
{
  interval <interval in secs>;
  moderate-threshold <percentage level>;
  high-threshold <percentage level>;
  critical-threshold <percentage level>;
  traceoptions;
  action <monitor | prevent | recover>;
}
```

Hierarchy Level [edit snmp health-monitor routing-engine]

Release Information Statement introduced in Junos OS Release 12.1X44-D10. Statement modified in Junos OS Release 12.1X45-D10.

Description Enable the system health management feature to use the specified parameters.

- Options**
- **interval**—Monitoring interval in seconds.
Default: 300 seconds
 - **moderate-threshold**—Percentage of moderate threshold level resource utilization.
Default: 70 percent.
 - **high-threshold** —Percentage of high-threshold level resource utilization.
Default: 80 percent.
 - **critical-threshold** —Percentage of critical threshold level resource utilization.
Default: 90 percent.
 - **traceoptions**—Enable tracing of system health monitoring daemon.
 - **action**—Enable action for all resources.
Default: If action is not enabled, the default is prevent.

WARNING: If the system health management action for an affected resource is configured to recover, then certain intrusive operations necessary for preventing system breakdown are taken. Intrusive operations can include restarting or terminating processes, deleting files, and so on. Such action information is logged in the system health management history and system log.

Required Privilege Level security—To view this statement in the configuration.
security-control—To add this statement to the configuration.

routing-instance

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	routing-instance <i>routing-instance-name</i> ;
Hierarchy Level	[edit snmp community <i>community-name</i>], [edit snmp community <i>community-name</i> logical-system <i>logical-system-name</i>], [edit snmp trap-group <i>group</i>]
Release Information	Statement introduced in Junos OS Release 8.3. Added to the [edit snmp community <i>community-name</i>] hierarchy level in Junos OS Release 8.4. Added to the [edit snmp community <i>community-name</i> logical-system <i>logical-system-name</i>] hierarchy level in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
Description	Specify a routing instance for SNMPv1 and SNMPv2 trap targets. All targets configured in the trap group use this routing instance. If the routing instance is defined within a logical system, include the logical-system <i>logical-system-name</i> statement at the [edit snmp community <i>community-name</i>] hierarchy level and specify the routing-instance statement under the [edit snmp community <i>community-name</i> logical-system <i>logical system-name</i>] hierarchy level.
Options	<i>routing-instance-name</i> —Name of the routing instance.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Trap Groups on page 141 • Configuring the Source Address for SNMP Traps on page 138 • Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community on page 161

routing-instance

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	routing-instance <i>routing-instance-name</i> ;
Hierarchy Level	[edit snmp v3 <i>target-address</i> <i>target-address-name</i>]
Release Information	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify a routing instance for an SNMPv3 trap target.
Options	<i>routing-instance-name</i>—Name of the routing instance. To configure a routing instance within a logical system, specify the logical system name followed by the routing instance name. Use a slash (/) to separate the two names (for example, test-ls/test-ri). To configure the default routing instance on a logical system, specify the logical system name followed by default (for example, test-ls/default).
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Trap Target Address on page 147

routing-instance-access

Supported Platforms	LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	<pre>[edit snmp] routing-instance-access { access-list { <i>routing-instance</i>; <i>routing-instance</i> restrict; } }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	Enable SNMP managers in routing instances other than the default routing instance to access SNMP information. For information about the access-list option, see access-list .
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Enabling SNMP Access over Routing Instances on page 161

sample-type

Supported Platforms	EX Series, LN Series, M Series, MX Series, T Series
Syntax	sample-type (absolute-value delta-value);
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Method of sampling the selected variable.
Options	absolute-value —Actual value of the selected variable is used when comparing against the thresholds. delta-value —Difference between samples of the selected variable is used when comparing against the thresholds.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Sample Type on page 181

security-level (Defining Access Privileges)

Supported Platforms	EX Series, LN Series, M Series, MX Series, QFX Series, T Series
Syntax	<pre>security-level (authentication none privacy) { notify-view view-name; read-view view-name; write-view view-name; }</pre>
Hierarchy Level	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix context-prefix <i>context-prefix</i>) security-model (any usm v1 v2c)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Define the security level used for access privileges.
Default	none
Options	authentication—Provide authentication but no encryption. none—No authentication and no encryption. privacy—Provide authentication and encryption.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Security Level on page 157

security-level (Generating SNMP Notifications)

Supported Platforms	EX Series, LN Series, M Series, MX Series, QFX Series, T Series
Syntax	security-level (authentication none privacy);
Hierarchy Level	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the security level to use when generating SNMP notifications.
Default	none
Options	authentication —Provide authentication but no encryption. none —No authentication and no encryption. privacy —Provide authentication and encryption.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Security Level on page 152

security-model (Access Privileges)

Supported Platforms	EX Series, LN Series, M Series, MX Series, QFX Series, T Series
Syntax	security-model (usm v1 v2c);
Hierarchy Level	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix context-prefix <i>context-prefix</i>)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the security model for an SNMPv3 group. The security model is used to determine access privileges for the group.
Options	usm—SNMPv3 security model. v1—SNMPv1 security model. v2c—SNMPv2c security model.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Security Model on page 157

security-model (Group)

Supported Platforms	EX Series, LN Series, M Series, MX Series, T Series
Syntax	<pre>security-model (usm v1 v2c) { security-name security-name { group group-name; } }</pre>
Hierarchy Level	[edit snmp v3 vacm security-to-group]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define a security model for a group.
Options	usm—SNMPv3 security model. v1—SNMPv1 security model. v2c—SNMPv2c security model.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Security Model on page 132

security-model (SNMP Notifications)

Supported Platforms	EX Series, LN Series, M Series, MX Series, QFX Series, T Series
Syntax	security-model (usm v1 v2c);
Hierarchy Level	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the security model for an SNMPv3 group. The security model is used for SNMP notifications.
Options	usm—SNMPv3 security model. v1—SNMPv1 security model. v2c—SNMPv2c security model.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Security Model on page 152

security-name (Community String)

Supported Platforms	EX Series, LN Series, M Series, MX Series, T Series
Syntax	security-name <i>security-name</i> ;
Hierarchy Level	[edit snmp v3 snmp-community <i>community-index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Associate the community string configured at the [edit snmp v3 snmp-community <i>community-index</i>] hierarchy level to a security name.
Options	<i>security-name</i> —Name used when performing access control.

NOTE: The security name must match the configured security name at the [edit snmp v3 target-parameters *target-parameters-name* parameters] hierarchy level when you configure traps or informs.

Required Privilege	snmp—To view this statement in the configuration.
Level	snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Security Names on page 169

security-name (Security Group)

Supported Platforms	EX Series, LN Series, M Series, MX Series, T Series
Syntax	<pre>security-name security-name { group group-name; }</pre>
Hierarchy Level	[edit snmp v3 vacm security-to-group security-model (usm v1 v2c)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Associate a group or a community string with a configured security group.
Options	security-name—Username configured at the [edit snmp v3 usm local-engine user <i>username</i>] hierarchy level. For SNMPv1 and SNMPv2c, the security name is the community string configured at the [edit snmp v3 snmp-community <i>community-index</i>] hierarchy level.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Assigning Security Names to Groups on page 132

security-name (SNMP Notifications)

Supported Platforms	EX Series, LN Series, M Series, MX Series, QFX Series, T Series
Syntax	security-name <i>security-name</i> ;
Hierarchy Level	[edit snmp v3 target-parameters <i>target-parameters-name</i> parameters]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the security name used when generating SNMP notifications.
Options	security-name —If the SNMPv3 USM security model is used, identify the user when generating the SNMP notification. If the v1 or v2c security models are used, identify the SNMP community used when generating the notification.

NOTE: The access privileges for the group associated with this security name must allow this notification to be sent.

If you are using the v1 or v2 security models, the security name at the [edit snmp v3 vacm security-to-group] hierarchy level must match the security name at the [edit snmp v3 snmp-community *community-index*] hierarchy level.

Required Privilege	snmp—To view this statement in the configuration.
Level	snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Security Name on page 152

security-to-group

Supported Platforms	EX Series, LN Series, M Series, MX Series, QFX Series, T Series
Syntax	<pre>security-to-group { security-model (usm v1 v2c) { group group-name; security-name security-name; } }</pre>
Hierarchy Level	[edit snmp v3 vacm]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the group to which a specific SNMPv3 security name belongs. The security name is used for messaging security. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Assigning Security Model and Security Name to a Group on page 132

snmp

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	snmp { ... }
Hierarchy Level	[edit]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure SNMP.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP on a Device Running Junos OS on page 109

source-address

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	source-address <i>address</i> ;
Hierarchy Level	[edit snmp trap-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the source address of every SNMP trap packet sent by this router to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.
Options	address —Source address of SNMP traps. You can configure the source address of trap packets two ways: lo0 or a valid IPv4 address configured on one of the router interfaces. The value lo0 indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface lo0 . Default: Disabled. (The source address is the address of the outgoing interface.)
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Source Address for SNMP Traps on page 138

snmp-community

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	<pre>snmp-community <i>community-index</i> { community-name <i>community-name</i>; security-name <i>security-name</i>; tag <i>tag-name</i>; }</pre>
Hierarchy Level	[edit snmp v3]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure the SNMP community.
Options	<i>community-index</i> —(Optional) String that identifies an SNMP community. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the SNMPv3 Community on page 168

startup-alarm

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	startup-alarm (falling-alarm rising-alarm rising-or-falling-alarm);
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The alarm that can be sent upon entry startup.
Options	falling-alarm—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold. rising-alarm—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold. rising-or-falling-alarm—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds. Default: rising-or-falling-alarm
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Startup Alarm on page 181

syslog-subtag

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	syslog-subtag <i>syslog-subtag</i> ;
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Add a tag to the system log message.
Options	syslog-subtag <i>syslog-subtag</i> —Tag of not more than 80 uppercase characters to be added to syslog messages. Default: None
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the System Log Tag on page 181

tag

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	tag <i>tag-name</i> ;
Hierarchy Level	[edit snmp v3 notify name], [edit snmp v3 snmp-community community-index]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure a set of targets to receive traps or informs (for IPv4 packets only).
Options	<i>tag-name</i> —Identifies the address of managers that are allowed to use a community string.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Tag on page 169 • Configuring the SNMPv3 Trap Notification on page 146

tag-list

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , QFX Series , T Series
Syntax	tag-list <i>tag-list</i> ;
Hierarchy Level	[edit snmp v3 target-address <i>target-address-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure an SNMP tag list used to select target addresses.
Options	<i>tag-list</i> —Define sets of target addresses (tags). To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Trap Target Address on page 149

target-address

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	<pre>target-address <i>target-address-name</i> { address <i>address</i>; address-mask <i>address-mask</i>; logical-system <i>logical-system</i>; port <i>port-number</i>; retry-count <i>number</i>; routing-instance <i>instance</i>; tag-list <i>tag-list</i>; target-parameters <i>target-parameters-name</i>; timeout <i>seconds</i>; }</pre>
Hierarchy Level	[edit snmp v3]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure the address of an SNMP management application and the parameters to be used in sending notifications.
Options	<i>target-address-name</i>—String that identifies the target address. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Trap Target Address on page 147

target-parameters

Supported Platforms [EX Series](#), [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [T Series](#)

Syntax At the `[edit snmp v3]` hierarchy level:

```
target-parameters target-parameters-name {  
  profile-name;  
  parameters {  
    message-processing-model (v1 | v2c | V3);  
    security-level (authentication | none | privacy);  
    security-model (usm | v1 | v2c);  
    security-name security-name;  
  }  
}
```

At the `[edit snmp v3 target-address target-address-name]` hierarchy level:

```
target-parameters target-parameters-name;
```

Hierarchy Level `[edit snmp v3]`
`[edit snmp v3 target-address target-address-name]`

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the `[edit snmp v3]` hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the `[edit snmp v3 target-parameters target-parameters-name]` hierarchy level to the target address configuration at the `[edit snmp v3]` hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- [Applying Target Parameters on page 150](#)

targets

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	<pre>targets { address; }</pre>
Hierarchy Level	[edit snmp trap-group <i>group-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure one or more systems to receive SNMP traps.
Options	address —IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Trap Groups on page 141

timeout

Supported Platforms	LN Series
Syntax	timeout <i>seconds</i> ;
Hierarchy Level	[edit snmp v3 target-address <i>target-address-name</i>]
Release Information	Statement introduced in Junos OS Release 7.4.
Description	Configure the timeout period (in seconds) for SNMP informs.
Options	seconds —Number of seconds to wait for an inform acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted. Default: 15
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Informs on page 121 • retry-count on page 245

traceoptions

Supported Platforms EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series

Syntax

```
traceoptions {  
    file filename <files number> <match regular-expression> <size size> <world-readable |  
        no-world-readable>;  
    flag flag;  
    no-remote-trace;  
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 7.4.
file *filename* option added in Junos OS Release 8.1.
world-readable | no-world-readable option added in Junos OS Release 8.1.
match *regular-expression* option added in Junos OS Release 8.1.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. Currently, the following logs are created in the **/var/log** directory when the **traceoptions** statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

Options **file *filename***—By default, the name of the log file that records trace output is the name of the process being traced (for example, **mib2d** or **snmpd**). Use this option to specify another name.

files *number*—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, **snmpd**) reaches its maximum size, it is archived by being renamed to **snmpd.0**. The previous **snmpd.1** is renamed to **snmpd.2**, and so on. The oldest archived file is deleted.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Log all SNMP events.

- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **subagent**—Log subagent restarts.
- **timer**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

size *size*—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

Range: 10 KB through 1 GB

Default: 1000 KB

world-readable | no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

Required Privilege	snmp—To view this statement in the configuration.
Level	snmp-control—To add this statement to the configuration.

Related Documentation	• Tracing SNMP Activity on a Device Running Junos OS on page 297
------------------------------	--

trap-group

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	<pre>trap-group group-name { categories { category; } destination-port port-number; routing-instance instance; targets { address; } version (all v1 v2); }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.
Options	group-name—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" "). The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Trap Groups on page 141

trap-options

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	<pre>trap-options { agent-address outgoing-interface; source-address address; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157. The remaining statements are explained separately.
Default	Disabled
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Trap Options on page 137

type

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	type (inform trap);
Hierarchy Level	[edit snmp v3 notify <i>name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. inform option added in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the type of SNMP notification.
Options	inform —Defines the type of notification as an inform. SNMP informs are confirmed notifications. trap —Defines the type of notification as a trap. SNMP traps are unconfirmed notifications.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Informs on page 121 • Configuring the SNMPv3 Trap Notification on page 146

type

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, T Series
Syntax	type <i>type</i> ;
Hierarchy Level	[edit snmp rmon <i>event index</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Type of notification generated when a threshold is crossed.
Options	<i>type</i>—Type of notification: • log—Add an entry to logTable. • log-and-trap—Send an SNMP trap and make a log entry. • none—No notifications are sent. • snmptrap—Send an SNMP trap. Default: log-and-trap
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring an Event Entry and Its Attributes on page 182

user

Supported Platforms	LN Series , M Series , MX Series , PTX Series , QFX Series , T Series
Syntax	<code>user <i>username</i>;</code>
Hierarchy Level	[edit snmp v3 usm local-engine], [edit snmp v3 usm remote-engine <i>engine-id</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify a user associated with an SNMPv3 group on a local or remote SNMP engine.
Options	<i>username</i> —SNMPv3 user-based security model (USM) username.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Creating SNMPv3 Users on page 123

usm

Supported Platforms LN Series, M Series, MX Series, PTX Series, QFX Series, T Series

Syntax

```
usm {
  local-engine {
    user username {
      authentication-md5 {
        authentication-password authentication-password;
      }
      authentication-none;

vacm

Supported Platforms [EX Series](#), [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [T Series](#)

Syntax

```
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
  security-to-group {
    security-model (usm | v1 | v2c);
    security-name security-name {
      group group-name;
    }
  }
}
```

Hierarchy Level [edit snmp **v3**]

Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure view-based access control model (VACM) information. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Defining Access Privileges for an SNMP Group on page 155

variable

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , T Series
Syntax	<code>variable <i>oid-variable</i>;</code>
Hierarchy Level	[edit snmp rmon alarm index]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Object identifier (OID) of MIB variable to be monitored.
Options	<i>oid-variable</i> —OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, 1.3.6.1.2.1.2.1.2.1.10.1). Alternatively, use the MIB object name (for example, <code>ifInOctets.1</code>).
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the Variable on page 182

version

Supported Platforms	EX Series , LN Series , M Series , MX Series , PTX Series , SRX Series , T Series
Syntax	<code>version (all v1 v2);</code>
Hierarchy Level	[edit snmp trap-group <i>group-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify the version number of SNMP traps.
Default	<code>all</code> —Send an SNMPv1 and SNMPv2 trap for every trap condition.
Options	<code>all</code> —Send an SNMPv1 and SNMPv2 trap for every trap condition. <code>v1</code> —Send SNMPv1 traps only. <code>v2</code> —Send SNMPv2 traps only.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring SNMP Trap Groups on page 141

view (Associating a MIB View with a Community)

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, SRX Series, T Series
Syntax	view <i>view-name</i> ;
Hierarchy Level	[edit snmp community <i>community-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Associate a view with a community. A view represents a group of MIB objects.
Options	<i>view-name</i> —Name of the view. You must use a view name already configured in the view statement at the [edit snmp] hierarchy level.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	• Configuring the SNMP Community String on page 165

view (Configuring a MIB View)

Supported Platforms [EX Series](#), [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Syntax `view view-name {
 oid object-identifier (include | exclude);
}`

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The **view** statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the **view** statement at the **[edit snmp community community-name]** hierarchy level.

NOTE: To remove an OID completely, use the `delete view all oid oid-number` command but omit the `include` parameter.

Options *view-name*—Name of the view.

The remaining statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

write-view

Supported Platforms	EX Series, LN Series, M Series, MX Series, PTX Series, QFX Series, T Series
Syntax	<code>write-view view-name;</code>
Hierarchy Level	[edit snmp v3 vacm access group <i>group-name</i> (default-context-prefix context-prefix <i>context-prefix</i>) security-model (any usm v1 v2c) security-level (authentication none privacy)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series switches.
Description	Associate the write view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).
Options	<i>view-name</i> —Name of the view for which the SNMP user group has write permission.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

CHAPTER 18

SNMP Traps

- [Managing Traps and Informs on page 289](#)

Managing Traps and Informs

Supported Platforms [M Series, MX Series, SRX Series, T Series](#)

The following sections contain a few tips on managing SNMP notifications:

- [Generating Traps Based on SysLog Events on page 289](#)
- [Filtering Traps Based on the Trap Category on page 290](#)
- [Filtering Traps Based on the Object Identifier on page 290](#)

Generating Traps Based on SysLog Events

Event policies can include an action that raises traps for events based on system log messages. This feature enables notification of an SNMP trap-based application when an important system log message occurs. You can convert any system log message, for which there is no corresponding trap, into a trap. If you are using network management system traps rather than system log messages to monitor your network, you can use this feature to ensure that you are notified of all the major events.

To configure a policy that raises a trap on receipt of an event, include the following statements at the **[edit event-options policy *policy-name*]** hierarchy level:

```
[edit event-options policy policy-name]  
events [ events ];  
then {  
    raise-trap;  
}
```

The following example shows the sample configuration for raising a trap for the event `ui_mgd_terminate`:

```
Generating Traps  
Based on SysLog  
Events      [edit event-options policy p1]  
              events ui_mgd_terminate;  
              then {  
                  raise-trap;  
              }
```

Filtering Traps Based on the Trap Category

SNMP traps are categorized into many categories. The Junos OS provides a configuration option, **categories** at the **[edit snmp trap-group trap-group]** hierarchy level, that enables you to specify categories of traps that you want to receive on a particular host. You can use this option when you want to monitor only specific modules of the Junos OS.

The following example shows a sample configuration for receiving only **link**, **vrrp-events**, **services**, and **otn-alarms** traps:

```
[edit snmp]
trap-group jnpr {
  categories {
    link;
    vrrp-events;
    services;
    otn-alarms;
  }
  targets {
    192.168.69.179;
  }
}
```

Filtering Traps Based on the Object Identifier

The Junos OS also provides a more advanced filter option that enables you to filter out specific traps based on their object identifiers. You can use the **notify-filter** option to filter out a specific trap or a group of traps.

The following example shows the sample configuration for excluding Juniper Networks enterprise-specific configuration management traps (note that the SNMPv3 configuration also supports filtering of SNMPv1 and SNMPv2 traps as is shown in the following example):

```
[edit snmp]
v3 {
  vacm {
    security-to-group {
      security-model v2c {
        security-name sn_v2c_trap {
          group gr_v2c_trap;
        }
      }
    }
  }
  access {
    group gr_v2c_trap {
      default-context-prefix {
        security-model v2c {
          security-level none {
            read-view all;
            notify-view all;
          }
        }
      }
    }
  }
}
```

```

    }
  }
  target-address TA_v2c_trap {
    address 10.209.196.166;
    port 9001;
    tag-list tg1;
    target-parameters TP_v2c_trap;
  }
  target-parameters TP_v2c_trap {
    parameters {
      message-processing-model v2c;
      security-model v2c;
      security-level none;
      security-name sn_v2c_trap;
    }
    notify-filter nf1;
  }
  notify v2c_notify {
    type trap;
    tag tg1;
  }
  notify-filter nf1 {
    oid .1.3.6.1.4.1.2636.4.5 exclude;
    oid .1 include;
  }
  snmp-community index1 {
    community-name "$9$tDLl01h7Nbw2axN"; ## SECRET-DATA
    security-name sn_v2c_trap;
    tag tg1;
  }
  view all {
    oid .1 include;
  }
}

```

Using the Ping MIB for Remote Monitoring Devices Running Junos OS

Supported Platforms [LN Series, M Series, MX Series, PTX Series, SRX Series, T Series](#)

A ping test is used to determine whether packets sent from the local host reach the designated host and are returned. If the designated host can be reached, the ping test provides the approximate round-trip time for the packets. Ping test results are stored in `pingResultsTable` and `pingProbeHistoryTable`.

RFC 2925 is the authoritative description of the Ping MIB in detail and provides the ASN.1 MIB definition of the Ping MIB.

Configuring the Remote Engine and Remote User

Supported Platforms [LN Series, M Series, MX Series, PTX Series, SRX Series, T Series](#)

To send inform messages to an SNMPv3 user on a remote device, you must first specify the engine identifier for the SNMP agent on the remote device where the user resides. The remote engine ID is used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host. When sending an inform message, the agent uses the credentials of the user configured on the remote engine (inform target).

To configure a remote engine and remote user to receive and respond to SNMP informs, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
usm {
  remote-engine engine-id {
    user username {
      authentication-md5 {
        authentication-key key;
      }
      authentication-none;
      authentication-sha {
        authentication-key key;
      }
      privacy-3des {
        privacy-key key;
      }
      privacy-aes128 {
        privacy-key key;
      }
      privacy-des {
        privacy-key key;
      }
      privacy-none;
    }
  }
}
```

For informs, **remote-engine engine-id** is the identifier for the SNMP agent on the remote device where the user resides.

For informs, **user username** is the user on a remote SNMP engine who receives the informs.

Informs generated can be **unauthenticated**, **authenticated**, or **authenticated_and_encrypted**, depending on the security level of the SNMPv3 user configured on the remote engine (the inform receiver). The authentication key is used for generating message authentication code (MAC). The privacy key is used to encrypt the inform PDU part of the message.

CHAPTER 20

Tracing Activity

- [Tracing SNMP Activity on a Device Running Junos OS on page 297](#)
- [Example: Tracing SNMP Activity on page 300](#)

Tracing SNMP Activity on a Device Running Junos OS

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [QFX Series](#), [SRX Series](#), [T Series](#)

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
 - chassisd
 - craftd
 - ilmid
 - mib2d
 - rmopd
 - serviced
 - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *System Log Monitoring and Troubleshooting Guide for Security Devices*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (`/var/log`) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the `[edit snmp]` hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 298](#)
- [Configuring Access to the Log File on page 298](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 299](#)
- [Configuring the Trace Operations on page 299](#)

Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed *filename.0*, then *filename.1*, and so on, until there are three trace files. Then the oldest trace file (*filename.2*) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the `[edit snmp traceoptions]` hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (*filename*) reaches 2 MB, *filename* is renamed *filename.0*, and a new file called *filename* is created. When the new *filename* reaches 2 MB, *filename.0* is renamed *filename.1* and *filename* is renamed *filename.0*. This process repeats until there are 20 trace files. Then the oldest file (*filename.19*) is overwritten by the newest file (*filename.0*).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the `[edit snmp traceoptions]` hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the `[edit snmp traceoptions]` hierarchy level:

```
[edit snmp traceoptions]
```

```
file no-world-readable;
```

Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file *filename*]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
  configuration;
  database;
  events;
  general;
  interface-stats;
  nonvolatile-sets;
  pdu;
  policy;
  protocol-timeouts;
  routing-socket;
  server;
  subagent;
  timer;
  varbind-error;
}
```

Table 18 on page 299 describes the meaning of the SNMP tracing flags.

Table 18: SNMP Tracing Flags

Flag	Description	Default Setting
all	Log all operations.	Off
configuration	Log reading of the configuration at the [edit snmp] hierarchy level.	Off
database	Log events involving storage and retrieval in the events database.	Off
events	Log important events.	Off
general	Log general events.	Off
interface-stats	Log physical and logical interface statistics.	Off

Table 18: SNMP Tracing Flags (*continued*)

Flag	Description	Default Setting
nonvolatile-set	Log nonvolatile SNMP set request handling.	Off
pdu	Log SNMP request and response packets.	Off
policy	Log policy processing.	Off
protocol-timeouts	Log SNMP response timeouts.	Off
routing-socket	Log routing socket calls.	Off
server	Log communication with processes that are generating events.	Off
subagent	Log subagent restarts.	Off
timer	Log internal timer events.	Off
varbind-error	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log agentd | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where **agent** is the name of an SNMP agent.

CHAPTER 21

Ping Tests

- [Starting a Ping Test on page 303](#)
- [Monitoring a Running Ping Test on page 304](#)
- [Gathering Ping Test Results on page 307](#)
- [Stopping a Ping Test on page 309](#)
- [Interpreting Ping Variables on page 309](#)

Starting a Ping Test

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

Before you start a ping test, configure a Ping MIB view. This allows SNMP **Set** requests on **pingMIB**. To start a ping test, create a row in **pingCtlTable** and set **pingCtlAdminStatus** to **enabled**. The minimum information that must be specified before setting **pingCtlAdminStatus** to **enabled** is:

- **pingCtlOwnerIndexSnmpAdminString**
- **pingCtlTestNameSnmpAdminString**
- **pingCtlTargetAddressInetAddress**
- **pingCtlTargetAddressTypeInetAddressType**
- **pingCtlRowStatusRowStatus**

For all other values, defaults are chosen unless otherwise specified. **pingCtlOwnerIndex** and **pingCtlTestName** are used as the index, so their values are specified as part of the object identifier (OID). To create a row, set **pingCtlRowStatus** to **createAndWait** or **createAndGo** on a row that does not already exist. A value of **active** for **pingCtlRowStatus** indicates that all necessary information has been supplied and the test can begin; **pingCtlAdminStatus** can be set to **enabled**. An SNMP **Set** request that sets **pingCtlRowStatus** to **active** will fail if the necessary information in the row is not specified or is inconsistent. For information about how to configure a view, see [“Setting SNMP Views” on page 93](#).

There are two ways to start a ping test:

- [Using Multiple Set Protocol Data Units \(PDUs\) on page 304](#)
- [Using a Single Set PDU on page 304](#)

Using Multiple Set Protocol Data Units (PDUs)

You can use multiple **Set** request PDUs (multiple PDUs, with one or more varbinds each) and set the following variables in this order to start the test:

- **pingCtlRowStatus** to **createAndWait**
- All appropriate test variables
- **pingCtlRowStatus** to **active**

Junos OS now verifies that all necessary information to run a test has been specified.

- **pingCtlAdminStatus** to **enabled**

Using a Single Set PDU

You can use a single **Set** request PDU (one PDU, with multiple varbinds) to set the following variables to start the test:

- **pingCtlRowStatus** to **createAndGo**
- All appropriate test variables
- **pingCtlAdminStatus** to **enabled**

Monitoring a Running Ping Test

Supported Platforms [LN Series](#), [SRX Series](#)

When **pingCtlAdminStatus** is successfully set to **enabled**, the following is done before the acknowledgment of the SNMP **Set** request is sent back to the client:

- **pingResultsEntry** is created if it does not already exist.
- **pingResultsOperStatus** transitions to **enabled**.

For more information, see the following sections:

- [pingResultsTable](#) on page 304
- [pingProbeHistoryTable](#) on page 306
- [Generating Traps](#) on page 307

pingResultsTable

While the test is running, **pingResultsEntry** keeps track of the status of the test. The value of **pingResultsOperStatus** is **enabled** while the test is running and **disabled** when it has stopped.

The value of **pingCtlAdminStatus** remains **enabled** until you set it to **disabled**. Thus, to get the status of the test, you must examine **pingResultsOperStatus**.

The **pingCtlFrequency** variable can be used to schedule many tests for one **pingCtlEntry**. After a test ends normally (you did not stop the test) and the **pingCtlFrequency** number

of seconds has elapsed, the test is started again just as if you had set **pingCtlAdminStatus** to **enabled**. If you intervene at any time between repeated tests (you set **pingCtlAdminStatus** to **disabled** or **pingCtlRowStatus** to **notInService**), the repeat feature is disabled until another test is started and ends normally. A value of 0 for **pingCtlFrequency** indicates this repeat feature is not active.

pingResultsIpTgtAddr and **pingResultsIpTgtAddrType** are set to the value of the resolved destination address when the value of **pingCtlTargetAddressType** is **dns**. When a test starts successfully and **pingResultsOperStatus** transitions to **enabled**:

- **pingResultsIpTgtAddr** is set to **null-string**.
- **pingResultsIpTgtAddrType** is set to **unknown**.

pingResultsIpTgtAddr and **pingResultsIpTgtAddrType** are not set until **pingCtlTargetAddress** can be resolved to a numeric address. To retrieve these values, poll **pingResultsIpTgtAddrType** for any value other than **unknown** after successfully setting **pingCtlAdminStatus** to **enabled**.

At the start of a test, **pingResultsSentProbes** is initialized to 1 and the first probe is sent. **pingResultsSentProbes** increases by 1 each time a probe is sent.

As the test runs, every **pingCtlTimeOut** seconds, the following occur:

- **pingProbeHistoryStatus** for the corresponding **pingProbeHistoryEntry** in **pingProbeHistoryTable** is set to **requestTimedOut**.
- A **pingProbeFailed** trap is generated, if necessary.
- An attempt is made to send the next probe.

NOTE: No more than one outstanding probe exists for each test.

For every probe, you can receive one of the following results:

- The target host acknowledges the probe with a response.
- The probe times out; there is no response from the target host acknowledging the probe.
- The probe could not be sent.

Each probe result is recorded in **pingProbeHistoryTable**. For more information about **pingProbeHistoryTable**, see “[pingProbeHistoryTable](#)” on page 306.

When a response is received from the target host acknowledging the current probe:

- **pingResultsProbeResponses** increases by 1.
- The following variables are updated:
 - **pingResultsMinRtt**—Minimum round-trip time
 - **pingResultsMaxRtt**—Maximum round-trip time

- **pingResultsAverageRtt**—Average round-trip time
- **pingResultsRttSumOfSquares**—Sum of squares of round-trip times
- **pingResultsLastGoodProbe**—Timestamp of the last response

NOTE: Only probes that result in a response from the target host contribute to the calculation of the round-trip time (RTT) variables.

When a response to the last probe is received or the last probe has timed out, the test is complete.

pingProbeHistoryTable

An entry in **pingProbeHistoryTable** (**pingProbeHistoryEntry**) represents a probe result and is indexed by three variables:

- The first two variables, **pingCtlOwnerIndex** and **pingCtlTestName**, are the same ones used for **pingCtlTable**, which identifies the test.
- The third variable, **pingProbeHistoryIndex**, is a counter to uniquely identify each probe result.

The maximum number of **pingProbeHistoryTable** entries created for a given test is limited by **pingCtlMaxRows**. If **pingCtlMaxRows** is set to 0, no **pingProbeHistoryTable** entries are created for that test.

Each time a probe result is determined, a **pingProbeHistoryEntry** is created and added to **pingProbeHistoryTable**. **pingProbeHistoryIndex** of the new **pingProbeHistoryEntry** is 1 greater than the last **pingProbeHistoryEntry** added to **pingProbeHistoryTable** for that test. **pingProbeHistoryIndex** is set to 1 if this is the first entry in the table. The same test can be run multiple times, so this index keeps growing.

If **pingProbeHistoryIndex** of the last **pingProbeHistoryEntry** added is 0xFFFFFFFF, the next **pingProbeHistoryEntry** added has **pingProbeHistoryIndex** set to 1.

The following are recorded for each probe result:

- **pingProbeHistoryResponse**—Time to live (TTL)
- **pingProbeHistoryStatus**—What happened and why
- **pingProbeHistoryLastRC**—Return code (RC) value of ICMP packet
- **pingProbeHistoryTime**—Timestamp when probe result was determined

When a probe cannot be sent, **pingProbeHistoryResponse** is set to 0. When a probe times out, **pingProbeHistoryResponse** is set to the difference between the time when the probe was discovered to be timed out and the time when the probe was sent.

Generating Traps

For any trap to be generated, the appropriate bit of **pingCtlTrapGeneration** must be set. You must also configure a trap group to receive remote operations. A trap is generated under the following conditions:

- A **pingProbeFailed** trap is generated every time **pingCtlTrapProbeFailureFilter** number of consecutive probes fail during the test.
- A **pingTestFailed** trap is generated when the test completes and at least **pingCtlTrapTestFailureFilter** number of probes fail.
- A **pingTestCompleted** trap is generated when the test completes and fewer than **pingCtlTrapTestFailureFilter** probes fail.

NOTE: A probe is considered a failure when **pingProbeHistoryStatus** of the probe result is anything besides **responseReceived**.

For information about how to configure a trap group to receive remote operations, see [“Configuring SNMP Trap Groups” on page 141](#) and [“Example: Setting Trap Notification for Remote Operations” on page 95](#).

Gathering Ping Test Results

Supported Platforms [LN Series](#), [M Series](#), [MX Series](#), [PTX Series](#), [SRX Series](#), [T Series](#)

You can either poll **pingResultsOperStatus** to find out when the test is complete or request that a trap be sent when the test is complete. For more information about **pingResultsOperStatus**, see [“pingResultsTable” on page 304](#). For more information about Ping MIB traps, see [“Generating Traps” on page 307](#).

The statistics calculated and then stored in **pingResultsTable** include:

- **pingResultsMinRtt**—Minimum round-trip time
- **pingResultsMaxRtt**—Maximum round-trip time
- **pingResultsAverageRtt**—Average round-trip time
- **pingResultsProbeResponses**—Number of responses received
- **pingResultsSentProbes**—Number of attempts to send probes
- **pingResultsRttSumOfSquares**—Sum of squares of round-trip times
- **pingResultsLastGoodProbe**—Timestamp of the last response

You can also consult **pingProbeHistoryTable** for more detailed information about each probe. The index used for **pingProbeHistoryTable** starts at 1, goes to 0xFFFFFFFF, and wraps to 1 again.

For example, if **pingCtlProbeCount** is 15 and **pingCtlMaxRows** is 5, then upon completion of the first run of this test, **pingProbeHistoryTable** contains probes like those in [Table 19 on page 308](#).

Table 19: Results in pingProbeHistoryTable: After the First Ping Test

pingProbeHistoryIndex	Probe Result
11	Result of 11th probe from run 1
12	Result of 12th probe from run 1
13	Result of 13th probe from run 1
14	Result of 14th probe from run 1
15	Result of 15th probe from run 1

Upon completion of the first probe of the second run of this test, **pingProbeHistoryTable** will contain probes like those in [Table 20 on page 308](#).

Table 20: Results in pingProbeHistoryTable: After the First Probe of the Second Test

pingProbeHistoryIndex	Probe Result
12	Result of 12th probe from run 1
13	Result of 13th probe from run 1
14	Result of 14th probe from run 1
15	Result of 15th probe from run 1
16	Result of 1st probe from run 2

Upon completion of the second run of this test, **pingProbeHistoryTable** will contain probes like those in [Table 21 on page 308](#).

Table 21: Results in pingProbeHistoryTable: After the Second Ping Test

pingProbeHistoryIndex	Probe Result
26	Result of 11th probe from run 2
27	Result of 12th probe from run 2
28	Result of 13th probe from run 2
29	Result of 14th probe from run 2

Table 21: Results in pingProbeHistoryTable: After the Second Ping Test (continued)

pingProbeHistoryIndex	Probe Result
30	Result of 15th probe from run 2

History entries can be deleted from the MIB in two ways:

- More history entries for a given test are added and the number of history entries exceeds **pingCtlMaxRows**. The oldest history entries are deleted to make room for the new ones.
- You delete the entire test by setting **pingCtlRowStatus** to **destroy**.

Stopping a Ping Test

Supported Platforms LN Series, M Series, MX Series, PTX Series, SRX Series, T Series

To stop an active test, set **pingCtlAdminStatus** to **disabled**. To stop the test and remove its **pingCtlEntry**, **pingResultsEntry**, and any **pingHistoryEntry** objects from the MIB, set **pingCtlRowStatus** to **destroy**.

Interpreting Ping Variables

Supported Platforms LN Series, M Series, MX Series, PTX Series, SRX Series, T Series

This section clarifies the ranges for the following variables that are not explicitly specified in the Ping MIB:

- **pingCtlDataSize**—The value of this variable represents the total size of the payload (in bytes) of an outgoing probe packet. This payload includes the timestamp (8 bytes) that is used to time the probe. This is consistent with the definition of **pingCtlDataSize** (maximum value of 65,507) and the standard ping application.

If the value of **pingCtlDataSize** is between 0 and 8 inclusive, it is ignored and the payload is 8 bytes (the timestamp). The Ping MIB assumes all probes are timed, so the payload must always include the timestamp.

For example, if you wish to add an additional 4 bytes of payload to the packet, you must set **pingCtlDataSize** to 12.

- **pingCtlDataFill**—The first 8 bytes of the data segment of the packet is for the timestamp. After that, the **pingCtlDataFill** pattern is used in repetition. The default pattern (when **pingCtlDataFill** is not specified) is (00, 01, 02, 03 ... FF, 00, 01, 02, 03 ... FF, ...).
- **pingCtlMaxRows**—The maximum value is 255.
- **pingMaxConcurrentRequests**—The maximum value is 500.
- **pingCtlTrapProbeFailureFilter** and **pingCtlTrapTestFailureFilter**—A value of 0 for **pingCtlTrapProbeFailureFilter** or **pingCtlTrapTestFailureFilter** is not well defined by the Ping MIB. If **pingCtlTrapProbeFailureFilter** is 0, **pingProbeFailed** traps will not be generated for the test under any circumstances. If **pingCtlTrapTestFailureFilter** is 0, **pingTestFailed** traps will not be generated for the test under any circumstances.

CHAPTER 22

Operational Commands

- `show snmp health-monitor`
- `show snmp health-monitor routing-engine history`
- `show snmp health-monitor routing-engine status`

show snmp health-monitor

Supported Platforms	LN Series, SRX100, SRX110, SRX210, SRX220, SRX240, SRX550, SRX650
Syntax	show snmp health-monitor <alarms <detail>> <logs>
Release Information	Statement introduced in Junos OS Release 12.1X44-D10 for SRX Series devices.
Description	Display information about SNMP health monitor alarms and logs.
Options	none —Display information about all health monitor alarms and logs. alarms <detail> —(Optional) Display detailed information about health monitor alarms. logs —(Optional) Display information about health monitor logs.
Required Privilege Level	view
List of Sample Output	show snmp health-monitor on page 314 show snmp health-monitor alarms detail on page 315 show snmp health-monitor alarms brief on page 316
Output Fields	Table 22 on page 312 describes the output fields for the show snmp health-monitor command. Output fields are listed in the approximate order in which they appear.

Table 22: show snmp health-monitor Output Fields

Field Name	Field Description
Alarm Index	Alarm identifier.
Variable description	Description of the health monitor object instance being monitored.
Variable name	Name of the health monitor object instance being monitored.
Value	Current value of the monitored variable in the most recent sample interval.

Table 22: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description
State	State of the alarm or event entry: - Alarms: moderate-threshold—Percentage of moderate threshold level resource utilization. high-threshold—Percentage of high-threshold level resource utilization. critical-threshold—Percentage of critical threshold level resource utilization. active—Entry is fully configured and activated. falling threshold crossed—Value of the variable has crossed the lower threshold limit. rising threshold crossed—Value of the variable has crossed the upper threshold limit. under creation—Entry is being configured and is not yet activated. startup—Alarm is waiting for the first sample of the monitored variable. object not available—Monitored variable of that type is not available to the health monitor agent. instance not available—Monitored variable's instance is not available to the health monitor agent. object type invalid—Monitored variable is not a numeric value. object processing errored—An error occurred when the monitored variable was processed. unknown—State is not one of the above.
Variable OID	Object ID to which the variable name is resolved. The format is x.x.x.x.
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of absolute value or delta value .
Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria: - Alarm is sent when one of the following situations exists: - Value of the alarm is above or equal to the rising threshold and the startup type is either rising alarm or rising or falling alarm. - Value of the alarm is below or equal to the falling threshold and the startup type is either falling alarm or rising or falling alarm. - Alarm is <i>not</i> sent when one of the following situations exists: - Value of the alarm is above or equal to the rising threshold and the startup type is falling alarm. - Value of the alarm is below or equal to the falling threshold and the startup type is rising alarm. - Value of the alarm is between the thresholds.
Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has monitor prepended to it.
Creator	Mechanism by which the entry was configured (Health Monitor).

Table 22: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description
Sample interval	Time period between samples (in seconds).
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.
Rising event index	Event triggered when the rising threshold is crossed.
Falling event index	Event triggered when the falling threshold is crossed.

Sample Output

show snmp health-monitor

```
user@host> show snmp health-monitor
```

show snmp health-monitor routing-engine history

Supported Platforms	LN Series, SRX100, SRX110, SRX210, SRX220, SRX240, SRX550, SRX650
Syntax	show snmp health-monitor routing-engine history resource <cpu memory open-files-count process-count storage temperature>;
Release Information	Statement introduced in Junos OS Release 12.1X44-D10 for branch SRX Series devices. Statement modified in Junos OS Release 12.1X45-D10.
Description	Display the health-monitoring information collected for a Routing Engine.
Options	brief —Displays brief health monitor history. extensive —Displays extensive health monitor history. terse —Displays terse health monitor history.
Required Privilege Level	view
Related Documentation	• show snmp health-monitor on page 312
List of Sample Output	show snmp health-monitor routing-engine history on page 319 show snmp health-monitor routing-engine history extensive on page 320 show snmp health-monitor routing-engine history terse on page 321
Output Fields	Table 23 on page 318 describes the output fields for the show snmp health-monitor routing engine history command. Output fields are listed in the approximate order in which they appear.

Table 23: show snmp health-monitor routing engine history Output Fields

Field Name	Field Description
Resource	Name of the health monitor object instance being monitored.
Event	Displays the latest event and time associated with the resource. The available events are: • Moderate Rising • High Rising • Critical Rising • Moderate Falling • High Falling • Critical Falling

Table 23: show snmp health-monitor routing engine history Output Fields (*continued*)

Field Name	Field Description
Configuration	Effective configuration of a resource. interval — Configured interval in seconds. moderate-threshold—Percentage of moderate threshold level resource utilization. high-threshold — Percentage of high-threshold level resource utilization. critical-threshold — Percentage of critical threshold level resource utilization. action — Configured action for a resource.
Usage Trail	Displays the previous usage records.
Top daemon	List of processes with high resource utilization.
Growing daemons	List of processes with high incremental resource utilization from the previous sample.
Top files	List of large files in a partition.
Growing files	List of files in a partition that have gotten larger since the previous sample.
Resource name	Name of the resource.
Latest event	Displays the latest event associated with the resource. The available events are: - Moderate Rising - High Rising - Critical Rising - Moderate Falling - High Falling - Critical Falling
Time elapsed	Displays the time elapsed since the event occurred.
Action	Displays the action associated with the resource. The available actions are: - Monitor - Prevent - Recover

show snmp mib (View)

Supported Platforms [LN Series](#), [SRX Series](#)

Syntax `show snmp mib (get | get-next | walk) (ascii | decimal) object-id`

Release Information Command introduced in Junos OS Release 9.4. Support for IPv4 and IPv6 systemwide policy statistics added in Junos OS Release 12.1X46-D10.

Description Display local SNMP MIB object values.

Options **get**—Retrieve and display one or more SNMP object values.

get-next—Retrieve and display the next SNMP object values.

walk—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.

ascii—Display the SNMP object's string indices as an ASCII-key representation.

decimal—Display the SNMP object values in the decimal (default) format. The **decimal** option is the default option for this command. Therefore, issuing the **show snmp mib (get | get-next | walk) decimal object-id** and the **show snmp mib (get | get-next | walk) object-id** commands display the same output.

object-id—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as **interfaces**). When entering multiple objects, enclose the objects in quotation marks.

NOTE: On all high-end SRX Series devices, the **show snmp mib** command will not display the output for security related MIBs. We recommend that you use an SNMP client and prefix **logical-system-name@** to the community name. For example, if the community is public, use **default@public** for default root logical system.

Required Privilege Level **snmp**—To view this statement in the configuration.

Output Fields Table 25 on page 325 describes the output fields for the **show snmp mib** command. Output fields are listed in the approximate order in which they appear.

Table 25: show snmp mib Output Fields

Field Name	Field Description
<i>name</i>	Object name and numeric instance value.
<i>object value</i>	Object value. The Junos OS translates OIDs into the corresponding object names.

Sample Output
