IMPORTANT
NomadNet provides open access to the Internet. All Internet security, antivirus, spy ware and ad-ware settings are determined by the security settings currently set on your wireless computer.

NomadNet Trouble Shooting Guide

Your Device can't detect the NomadNet wireless signal

Some Apple Devices cant pick up wireless signals at a far distance. You should be able to take your apple device closer to the reception of the venue you are staying at. once closer check your wifi for nomadnet. connect to it the walk back to your area and it should stay connected

1. All laptops have a switch or hot key to turn the internal wireless antenna on or off. This needs to be on to connect to NomadNet.
2. Common connection for the wireless switches are s follows;
   a) Slide or push button on the front or side of the laptop.
   b) Switch or button at the top of the keyboard - usually has an indicator light.
   c) A Function Key, commonly the F2, F5 or F8 key. The Fn key must be held down for the function keys to work.

Your Device connects to NomadNet, but you get nothing when you open the internet

1. As the NomadNet web page does not require a code to access it, type in www.nomadnet.net.au in the address line of your web browser, and see if that opens. If it does, click on 'Card Login' to go to the login page.
2. It Step 1 doesn't work, there are two possible causes.

   I) **Personal or home laptops.** If you use you laptop computer on a home wireless system you may have a manual IP address, follow the instructions below for **Windows XP or Vista/7 and 8** (Vista/7 instructions in blue).

   (1) Right click on Network connections Icon.
   (2) Click on "Open Network Connections". (Network & Sharing Centre).
   (3) Double Click on Wireless Network Connections
   (Manage Network Connections).   Vista wireless
   (4) Double Click on Wireless Network Connection.
   (5) Click on the properties button.
   (6) Double Click "Internet Protocol (TCP/IP)" (Internet Protocol Version 4). This may be the last item on the centre list, so you may have to scroll down.
   (7) "Obtain an IP address automatically" and "Obtain DNS Server automatically" need to be checked. If not checked, record any numbers and then check both.
   (8) Once this is done, click OK and both windows and close all others.
   (9) The computer will re-connect to NomadNet so try the internet again after 10 seconds.

   For **Windows 7** follow the instructions below.
   (1) Right Click on the Network Icon
   (2) Open "Network & Sharing Centre"   Windows 7
   (3) Click on "Change adaptor settings"   wireless icon
   (4) Right Click "Wireless Network Connections"
   (5) Go to step 6 above

   II) **Work supplied laptops.** Laptops that use an Intranet will need the proxy settings temporarily disabled (see below) when you return to the workplace just enable the proxy settings to (
   (1) Open Internet Explorer or your preferred web browser.
   (2) Click the Tools menu item.
   (3) Select Internet Options.
   (4) Click the Connections tab.
   (5) Click the LAN settings button located at the lower right position.
   (6) Ensure automatically detect settings is the only option checked.
   (7) Uncheck Proxy server & Auto configuration script (existing details disabled, not deleted).
   (8) Click OK on both windows and close and open internet explorer to www.nomadnet.net.au.
