

# Ultra Video Gallery 5

## User Guide

← Expand the “Bookmark” menu in left side to see the table of contents.

## Overview

Ultra Video Gallery (UVG) is a **DotNetNuke** (DNN) application designed to work in DotNetNuke websites ONLY. This documentation assumes that you have prior experience with the DotNetNuke environment. For further information about DotNetNuke, please refer to DNN information found at <http://www.dotnetnuke.com>.

### Why need Ultra Video Gallery

Video clip is everywhere in our world, you can take it by your home digital camera / computer camera / mobile phone, you can get it from your DVD or VCD disk, you can record your screen by screen recorder softwares to make learning courses, you can find favorite videos on Youtube or other video community websites, but it may not be an easy job to share videos in various formats on your DotNetNuke website.

A common experience is to upload videos to Youtube and embed it back to your website, this may be a possible solution if you have only 1 or 2 videos, but it won't work if you have numerous videos to publish.

Is there a better solution? Yes, the most-widely adopted DotNetNuke video gallery module, Ultra Video Gallery, allows you to create mini Youtube-style website on DotNetNuke since 2007.

### What can Ultra Video Gallery do?

**Allow site users to add new videos:** UVG allows you to add videos in many ways, you can upload videos from your local computer, or add videos from internet URL or a Youtube page, it even allows you to record live videos from webcam when work together with Flash Media Server .

**Encode uploaded videos for internet usage:** similar to Youtube, UVG allows you to upload videos in any popular formats, , once uploaded, UVG encode them to FLV or MP4 format with H264 encoding, both formats are specially designed for internet usage with a good balance of video quality and bandwidth cost.

**Browse and play videos:** UVG allows your visitors to easily find desired videos and watch it, our player works on mobile devices like iPhone/iPad, users can easily share a video on Facebook, Twitter and many other social websites.

### Video formats supported by UVG

Generally speaking, most video formats that you can imagine are supported by UVG, below is an incomplete list.

	<b>Microsoft WMV 1/2/3</b> .wmv, .wm, .asf,		<b>Mpeg-2 encoded DVD video</b> .mpg, .vob
	<b>Real Media</b> .rm, .rmvb,		<b>Mpeg 1/2</b> .mpg, .mpeg, .mpe
	<b>Apple Quicktime</b> .mov		<b>Mobile phone video format</b> .3gp, .3g2
	<b>DivX/XVID/Motion Jpeg</b> .avi		<b>Apple/Sony mp4</b> .mp4, .m4v

UVG video player shares color scheme with [Ultra Media Gallery](#) player. So it is ideal to use both products on your website together and present similar user experience.

UVG comes with 20+ DNN modules, the most important 5 are listed below:

1. **UVG\_Setup**  
This module allows you to do setup UVG and config it.
2. **UVG\_AddVideo**  
This module allows you to add videos to UVG in 4 different ways.
3. **UVG\_VideoList**  
The major video listing module in UVG, users can use filters to find desire videos.
4. **UVG\_VideoPlayer**  
After picking a video in UVG\_VideoList, users are redirected to UVG\_VideoPlayer to watch it, related videos and video comments are also displayed here.
5. **UVG\_MyVideos**  
This module allows current logged in user to manage his own videos and series.

UVG comes with many other sub modules & applications to better work on your website:

6. **UVG\_ActiveUsers**  
This module displays a list of most active users in specific period.
7. **UVG\_CategoryList**  
This module allows you to manage and list video categories.
8. **UVG\_Commercial**  
This module allows you to manage 4 kinds of commercials; commercials will be played in UVG\_VideoPlayer after creation.
9. **UVG\_CompactPlayer**  
This module allows you to play a fixed or dynamic video in a compact player interface.

10. **UVG\_FreeSeriesList**

Similar to UVG\_FreeVideoList, this module displays an incomplete series list with various sort options

11. **UVG\_FreeVideoList**

This module renders an incomplete video list, you can use it to create latest videos module, most popular videos module... and more.

12. **UVG\_MediaCenter**

Beside the traditional UVG\_VideoList + UVG\_VideoPlayer implementation, this module allows you to build a video gallery of specific set of videos in single page.

13. **UVG\_PendingVideos**

If you enable video approval, new videos appears in this module, video managers can approve or reject pending items.

14. **UVG\_SimpleVideoList**

This module displays all videos of chosen library in a text-only layout.

15. **UVG\_TagList**

This module displays tag cloud, you can click a tag to see all videos with it.

16. **UVG\_VideoInfo**

Must be used together with UVG\_VideoPlayer, you can use template to customize it final output.

17. **UVG\_WatchHistory**

This module renders a list of latest watched videos.

18. **UVG Converter**

This is a client-side desktop application, this tool can encode videos on your local computer and upload encoded files to UVG on your remote website.

## What's new in UVG 5

Ultra Video Gallery 5 comes with many important enhancements to extend its usability, below is a quick preview.

- 1. Video library**  
UVG 5 allows you to create unlimited video libraries in each portal. A library is a set of videos with its unique categories, series and videos.
- 2. Multiple category selection**  
UVG 5 allows videos to be added to multiple categories.
- 3. Video encoding queue**  
Once a video is uploaded, it's appended to the end of the encoding queue and the user is not required to wait for the completion of encoding, which greatly reduce your time to upload bulk videos.
- 4. Enhanced encoding engine**  
The video encoding engine is enhanced to better support latest video encoding standards.
- 5. RadUpload support**  
The prior versions of UVG use a 3<sup>rd</sup> party component, NeatUpload, to offer video upload progress, since UVG 5, it automatically switch to RadUpload when work on DNN 6.x.
- 6. Enhanced UVG\_VideoList**  
We fully rewrote UVG\_VideoList, the main video listing module, the new version allows your visitors to easily filter videos by category, date added, tags ... etc.
- 7. Fully works on iPhone/iPad**  
UVG automatically detects client device and use HTML 5 to play videos/audios on iPhone/iPad, even the video player is embedded to other websites.
- 8. Video subtitle**  
UVG now support subtitles in .srt or .vtt format. If you use UVG to host movies, or you just wish to add some text description to your video. This feature greatly helps you.

For more information on the latest enhancements to UVG, please see the [Release Notes](#) on bizmodules.net.

## System requirements

Ultra Video Gallery is designed to work in **ALL DNN 4.5.x and higher** websites, including but not restricted to 4.5.x, 4.6.x, 4.7.x, 4.8.x, 4.9.x, 5.0.x, 5.1.x, 5.2.x, 5.3.x, 5.4.x, 5.5.x, 5.6.x, 6.0.x, 6.1.x, 6.2.x.

Ultra Video Gallery even works on websites run in "medium trust" on shared servers but there are some restrictions.

### Luanching External Process

To encode videos and capture video screenshot, UVG need support from a series of codecs, these codecs are included in our "binary pack", you must install it together with UVG, UVG is not able to do video encoding if the binary pack is not installed.

To interact with the binary pack, **your IIS account** must have **EXECUTE permission** on /Desktopmodules/UltraVideoGallery/Binaries folder, if this permission is denied by your server configuration the video encoding will not work, if you are not sure if this permission is available, please install UVG at first and use UVG\_Setup module to detect it, for further information about this please refer to next chapter.

If you add videos from internet or record videos from webcam, this limitation is not applied, you can leave the binary pack alone if you do not plan to upload videos.

### Fully UVG-Supported Hosting

In most case you don't need to choose a special hosting company to run Ultra Video Gallery, the existence of UVG Converter ensures every body can use this product even you are not able to pass the permission check, however, if you do want to use UVG it self to do online video encoding, you may consider to move your website to a fully UVG-supported hosting company, click [here](#) to see our recommendations.

## Installation guide

The installation file of Ultra Video Gallery contains 2 parts, standard module **PA** (Private Assembly) and **binary pack**.

You can install module PA as normal DNN modules, which should be done in Host – Extensions (or Host – Module Definitions), for further information about how to install a DNN module please refer to DotNetNuke manual.

In the installation process, you should not see any red texts, there must be some problems if you do get any red message, in this case please first ensure the module PA you downloaded is not corrupted, for testing purpose you can try to open it in winzip; another possible reason is your IIS account does not have write permission on your DNN folder, you can try to install another module to see whether it reports the same error. If you still have trouble with it, please send the error message to us for trouble shooting.

If you get this message while installing UVG:

**The package contains files with invalid File Extensions.**

Ignore File Restrictions?

This is because a file with asmx extension is in the PA which is not allowed by a default DNN website, to fix this problem, simply add asmx to Host Settings -> Advanced Settings -> Other Settings -> File Upload Extensions, or simply check **Ignore File Restrictions** to continue.

If you installed any prior version of UVG before, you may get this message while installing it:

 The package is already installed.

By default the installer will not overwrite the same Package/Version. If you would like the installer to continue anyway, check the box. Otherwise you will not be able to proceed any further with this installation.

Repair Install?

Simply check Repair Install to continue.

As discussed in the previous chapter, if you wish to upload videos in any format you must install the **Binary Pack**, which is not included in UVG PA because of its file size. However, if you just add videos from the internet, or record videos from a webcam, or you plan to add videos from UVG Converter, you can skip the rest of this chapter.

The binary pack is a zip file which contains necessary codecs and utilities, you can download it [here](#), to install it is pretty simple, just unpack it to get a folder named "Binaries", then copy all files in this folder to /DesktopModules/UltraVideoGallery/Binaries folder on your website, if your website is located on a remote server, you may need to use FTP.

The binary pack for UVG 5 is different from prior versions, which means you should reinstall it when upgrading UVG from any prior versions.

## Upgrade guide

When upgrade from prior versions, you should carefully read this chapter before continue.

### Make a backup

It is strongly suggested to make a valid backup before doing an upgrade, you can leave portal root/UltraVideoGallery alone from the backup because it may be too big.

### Binary pack

The binary pack must be reinstalled.

### Reactivation

You need to [upgrade your license](#) and reactivate UVG.

### Obsolete Modules

These modules, if exists, are no longer supported, you need to delete them or replace them with other modules:

- UVG\_CategoryListNested
- UVG\_MySeries
- UVG\_VideoRating under UVG\_VideoPlayer definition
- UVG\_VideoInformation under UVG\_VideoPlayer definition
- UVG\_SearchInput
- UVG\_VideoSpotLight
- UVG\_LatestVideos
- UVG\_PopularVideos
- UVG\_UserVideos and
- UVG\_FirstRun

Ensure you no longer use above modules, then you can leave them alone of uninstall them in Host – Extensions (or Host – Module Definition). Before uninstalation please connect to your website by FTP, find Uninstall.SqlDataProvider in \DesktopModules\UltraVideoGallery folder, rename it to anything else, then you can safely uninstall above modules and put Uninstall.SqlDataProvider back.

## Uninstallation guide

Once you uninstall this product, all data you entered are lost and there isn't any opportunity to recover them, so please make appropriate backups before uninstallation if necessary.

To uninstall UVG from DNN 4.x and 5.x, please check to see if **web.config.uvg** exists in your site root, if there is, delete web.config and rename web.config.uvg to web.config.

To uninstall this product, uninstall all modules with UVG\_ prefix in Host – Extensions (or Host – Module Definition).

If you have UVG 5 installed but wish to start from scratch, simply delete UVG\_AddVideo module is enough.

Your videos are stored in \$Portal Root/UltraVideoGallery folder and are not affected when uninstall UVG, you can leave them alone or delete this folder.

## Obtaining technical support

As a licensed user of a Biz Modules product, we offer you long-term technical support, for the life of the product, should you require technical support at any time.

Priority support is provided in the Biz Modules technical support forum. In the forum you can browse topics submitted by other users, or post a new topic if you find that your issue has not yet been discussed in the forum.

You can reach the support forum at: <http://www.bizmodules.net/Forums/tabid/55/Default.aspx>

For brief questions about Ultra Video Gallery and for all other matters regarding Biz Modules, email: [service@bizmodules.net](mailto:service@bizmodules.net)

# Getting started

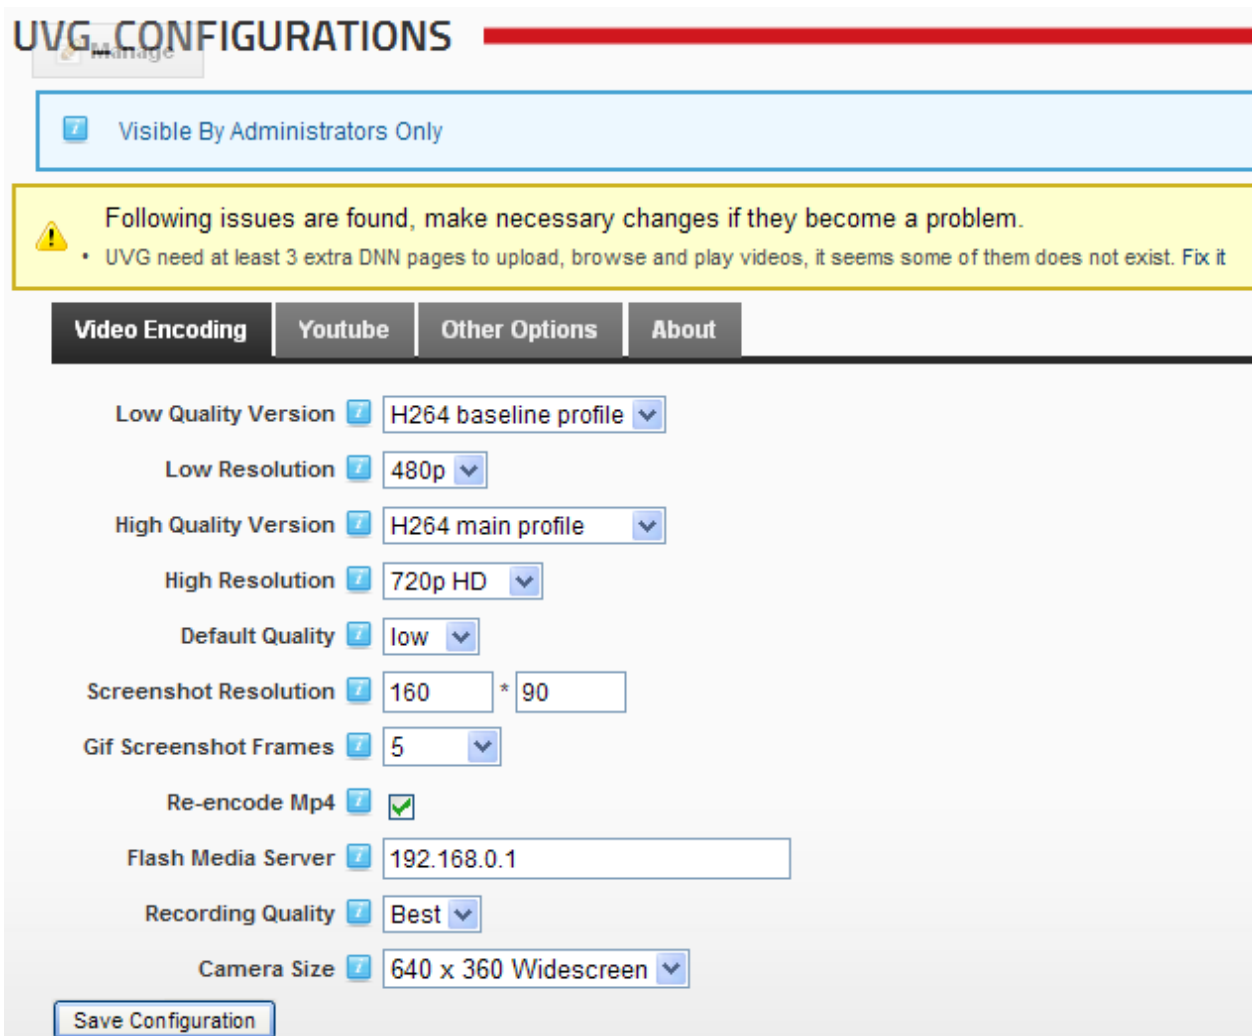

## Setup UVG

In most case, you need more than 3 tabs (pages) to host UVG modules, at first, please create a tab as the parent tab of all UVG tabs.

Then you should create a tab under the parent tab, which will be used to setup UVG:

Now find **UVG\_Setup** module in module list and add it to the sub tab created above.

A screenshot of the 'UVG CONFIGURATIONS' module interface. At the top, there is a 'Manage' button. Below it is a blue box with a checkbox labeled 'Visible By Administrators Only'. A yellow warning box contains a warning icon and the text: 'Following issues are found, make necessary changes if they become a problem. • UVG need at least 3 extra DNN pages to upload, browse and play videos, it seems some of them does not exist. Fix it'. Below the warning is a navigation bar with tabs: 'Video Encoding', 'Youtube', 'Other Options', and 'About'. The 'Video Encoding' tab is active. It contains several settings: 'Low Quality Version' (H264 baseline profile), 'Low Resolution' (480p), 'High Quality Version' (H264 main profile), 'High Resolution' (720p HD), 'Default Quality' (low), 'Screenshot Resolution' (160 \* 90), 'Gif Screenshot Frames' (5), 'Re-encode Mp4' (checked), 'Flash Media Server' (192.168.0.1), 'Recording Quality' (Best), and 'Camera Size' (640 x 360 Widescreen). A 'Save Configuration' button is at the bottom.

In the top of this module you can find a warning area with yellow background, it tells you issues that

may need to be corrected, when you use it for the first time it tells you that you need at least 3 extra DNN pages, simply click the **Fix it** link to create these pages, then you can see the new created pages in your DNN menu when re-enter the Config page:

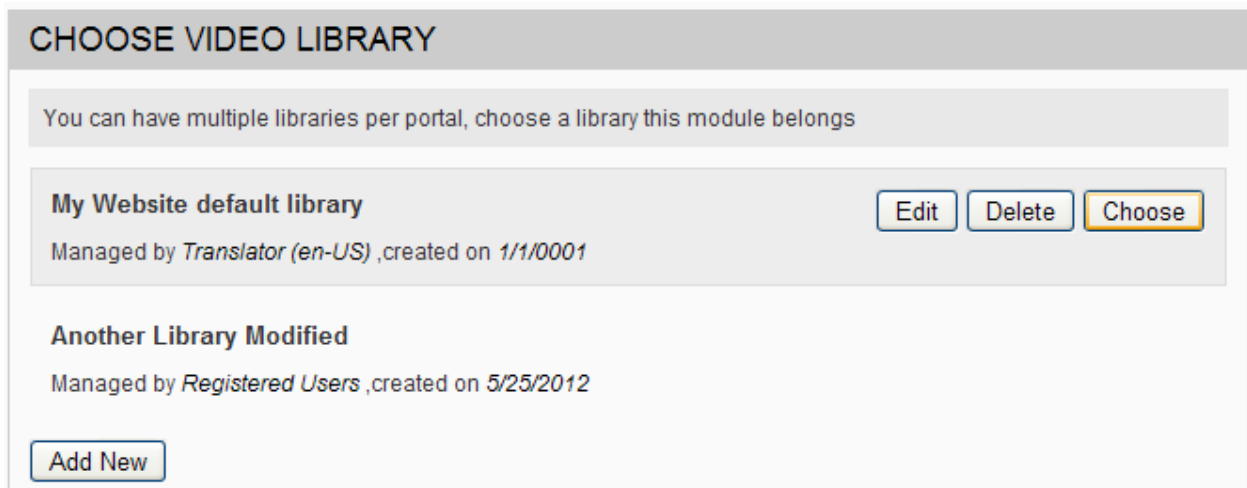

An UVG\_VideoList module is added to **Videos** page which is used to display video list, an UVG\_AddVideo module is added to **Add Video** page which is used add new videos, **My Videos** page includes an instance of UVG\_MyVideos module which is used to manage your own works. Beside that, UVG\_VideoPlayer is added to a hidden page, **Video Player**, which is used to play videos when your visitors click a video in UVG\_VideoList.

These are the minimal pages needed to use UVG, if you are an experienced user you can adjust it to meet your own needs.

After fixing the minimal UVG pages issue, there may be some other issues that need to be corrected in UVG\_Setup module, the good news is all of them can be done by simply clicking the **Fix it** button offered by UVG.

Now you are almost ready to add your 1<sup>st</sup> video to UVG, navigate to the Add Video page UVG created, it prompts you to choose a library like this:

UVG allows you to have multiple libraries per portal, so you have to choose which library this module works in, simply choose the default library UVG created for you and you are all set.

## Hello world!

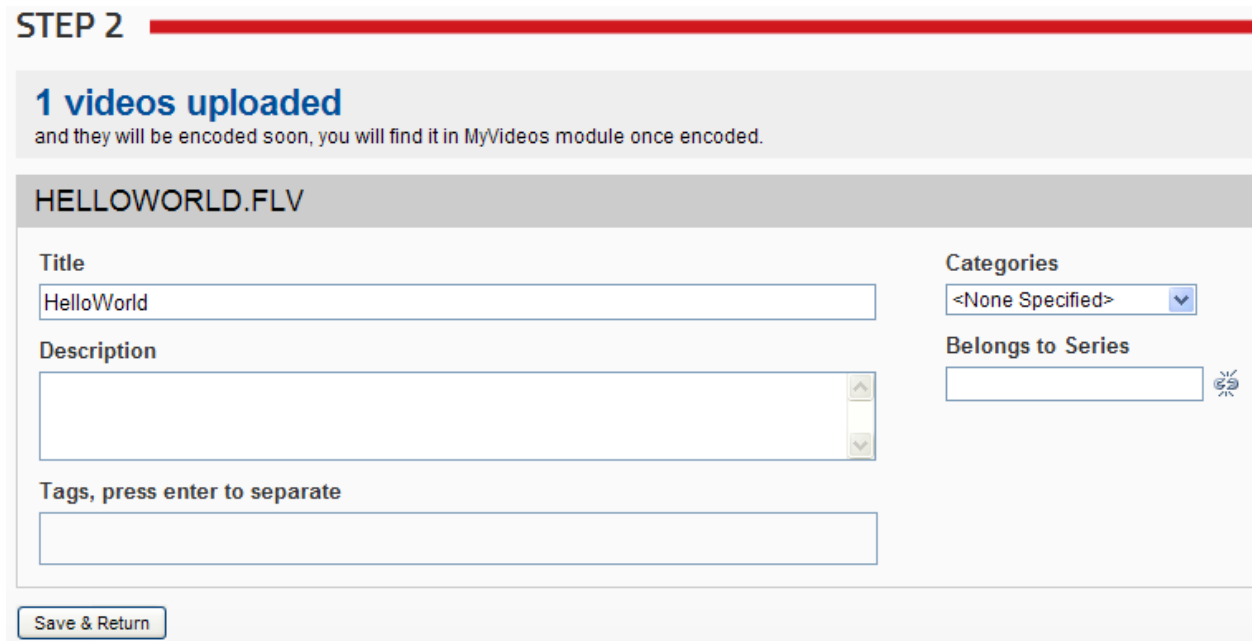

Now let's add a sample Hello world video to demonstrate how to use this product in the simplest manner.

We assume you already read and done necessary works described in previous chapter, now please navigate to your Add Video page UVG created, you should see a screen like this:

If you do not have a test video you can download our Hello World video from [here](#):

Unzip it to get an flv video, upload it in UVG\_AddVideo module. Once uploaded you will be able to edit its properties:

Optionally enter something to describe this video and save it.

Now go to the Videos page, you should see the sample video in the video list, if it prompts to choose a library, choose the default one.

Click the Hello World video and you should be redirected to the video player page to watch it.

## Libraries

As described in the **Setup UVG** chapter, UVG 5 allows you to have multiple libraries, when add these modules to a DNN page they ask you to choose a library it works in:

- UVG\_AddVideo
- UVG\_VideoList
- UVG\_CategoryList
- UVG\_CompactPlayer
- UVG\_MediaCenter

Other modules do not require you to choose a library because they are designed to work with all libraries.

UVG creates a default library for each portal, if you wish to have 1 library per portal you can simply use it, otherwise you need to create new:

**CHOOSE VIDEO LIBRARY**

You can have multiple libraries per portal, choose a library this module belongs to.

**UVG Default Library**  
Managed by *Administrators*, created on *6/11/2012*

**Library Name**

**Managers**

Administrators  
  Managers  
  SocialGroup\_Admin  
  SocialGroup\_Member  
  Subscribers  
 Approvers  
  Registered Users

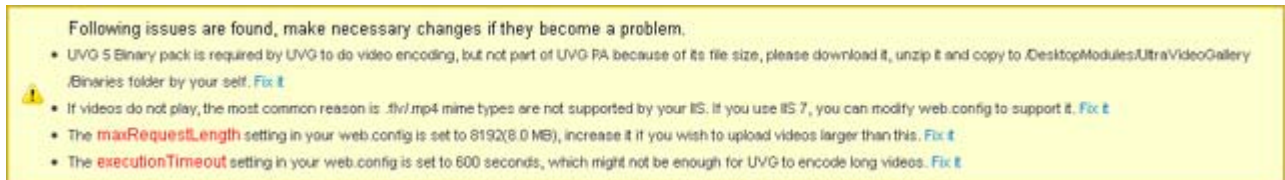

**Play videos in**

You can choose some DNN roles as library managers, these users are able to use some previlged features like editing videos or other authors, video approval...

The last option dictates the DNN page, with UVG\_VideoPlayer module, to play videos in this library, a video player page may serve one or multiple libraries.

## Configuration

After creating necessary DNN pages to host UVG modules, you might see these warnings in UVG\_Setup module:

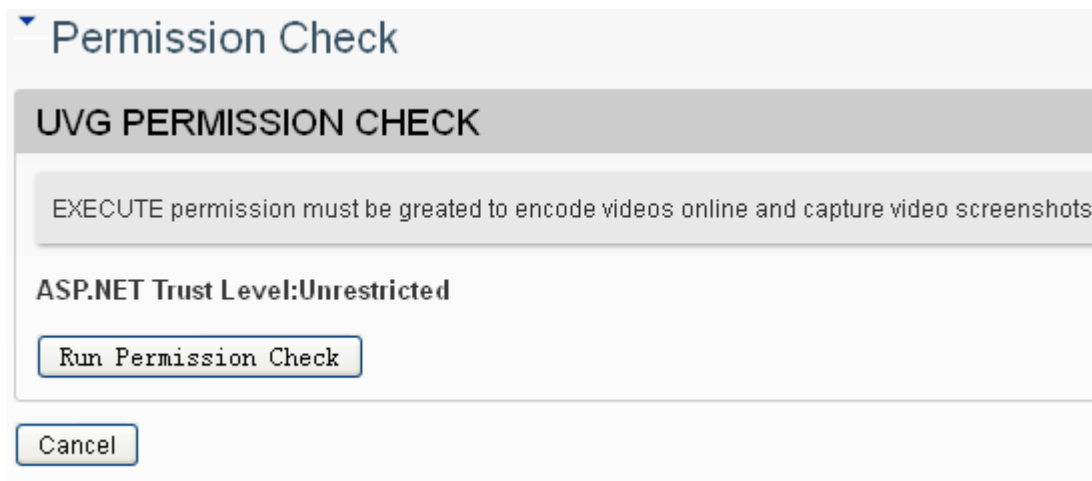

Following issues are found, make necessary changes if they become a problem.

- UVG 5 Binary pack is required by UVG to do video encoding, but not part of UVG PA because of its file size, please download it, unzip it and copy to .DesktopModules\UltraVideoGallery\Binaries folder by your self. [Fix it](#)
- If videos do not play, the most common reason is: .flv/.mp4 mime types are not supported by your IIS. If you use IIS 7, you can modify web.config to support it. [Fix it](#)
- The `maxRequestLength` setting in your web.config is set to 8192(8.0 MB), increase it if you wish to upload videos larger than this. [Fix it](#)
- The `executionTimeout` setting in your web.config is set to 600 seconds, which might not be enough for UVG to encode long videos. [Fix it](#)

Most issues can be corrected by the **Fix It** link, however, you might not need to correct some of them, for example, if you do not upload large files, you can leave the `maxRequestLength` alone.

If you use UVG to encode videos online, follow its instruction to install the binary pack, then you can see the link to run permission check so UVG knows if your server supports necessary permissions to encode videos, you will be redirected to a page like this:

Permission Check

**UVG PERMISSION CHECK**

EXECUTE permission must be granted to encode videos online and capture video screenshots.

ASP.NET Trust Level:Unrestricted

Run Permission Check

Cancel

Click Run permission check button to test the permission set, if you pass it, UVG allows you to upload videos in any format, otherwise you are limited to upload videos in .flv and .mp4 format only.

The other parts of UVG\_Setup module looks like this:

The 1st section is video encoding strategy, UVG allows you to encode videos in 3 formats:

- FLV
- H264 baseline profile, iOS compatible
- H264 main profile

Please note H264 is only available in UVG Professional Edition, so you will only be able to select FLV when use Standard Edition.

Our recommended choice is to choose H264 baseline profile for low quality version and H264 main profile for the high quality version.

UVG\_Setup module offers many options to customize how UVG works, in later chapters we will discuss some of them.

## Add videos

Basically, UVG allows you to add videos in 5 ways:

- Upload videos from your local disk
- Link to a video on internet URL
- Add videos from embed code
- Record live videos from webcam
- Upload videos by UVG Converter.

In this chapter we only discuss the first 3 ways.

### Upload video

As you can see in Hello World chapter, it is quite simple to upload a video from your local disk.

A significant difference between UVG 5 and prior version is that, you are no longer required to wait for the completion of video encoding, uploaded videos will be appended to UVG **video encoding queue**, the encoding scheduler, which can be seen in Host – Schedule, runs every 2 minutes picking the 1<sup>st</sup> video with highest priority in the queue and encode it, video authors get email notifications when the video is either encoded or failed.

Videos uploaded by video managers are granted higher priority in the queue.

### Link video

If your videos are already on internet you can add it to UVG with “Link to a video on internet” option:

The screenshot shows the UVG\_ADDVIDEO interface. On the left, under the heading "LINK TO A VIDEO ON INTERNET", there is a text box with the instruction: "You can add either a .flv/.mp4 video on internet, or a Youtube URL, leave the : when use Youtube." Below this are two input fields: "Video URL" and "Screenshot". A "Save Video" button is located at the bottom left. On the right, under the heading "MORE OPTIONS TO ADD", there are three buttons: "Upload a video" (with a folder icon and subtext "Upload from your local computer"), "Embed a video" (with a code icon and subtext "From a piece of HTML code"), and "Record a video" (with a webcam icon and subtext "From your webcam and microphone").

You are required to provide a video screenshot in this case, because UVG is not able to capture a screenshot for videos on internet.

The Video URL could either be a .flv or .mp4 file, or a Youtube page URL, when add video from Youtube UVG is able to automatically retrieve its screenshot so you do not need to provide it.

### Add video from embed code

Most video websites, like Youtube, offers "Embed Code" which allows you to embed a video on their website to anywhere on internet, UVG allows you to add this kind of videos:

The screenshot shows a web interface for adding videos. At the top, there is a red header bar with the text 'UVG\_ADDVIDEO'. Below this, the main content is divided into two columns. The left column is titled 'ADD VIDEO FROM EMBED CODE' and contains a grey box with the instruction 'Leave the screenshot empty when add from Youtube.' Below this are two text input fields: 'Embed Code' and 'Screenshot'. A 'Save Video' button is located at the bottom of this section. The right column is titled 'MORE OPTIONS TO ADD' and contains three options: 'Upload a video' (with a folder icon and the text 'Upload from your local computer'), 'Link a video' (with a link icon and the text 'From a internet URL or Youtube'), and 'Record a video' (with a microphone icon and the text 'From your webcam and microphone').

When add videos from Youtube embed code you are not required to provide the screenshot URL.

## Youtube integration

When add videos from Youtube with either “Link video” or “Embed video” option, UVG automatically converts it to an embedded video.

To ensure all Youtube videos have unique appearance, UVG has its own settings to control the style of Youtube player,

Find the Youtube tab in UVG\_Setup module:

The screenshot shows the configuration interface for the Youtube tab in the UVG\_Setup module. It features a navigation bar with tabs for "Video Encoding", "Youtube", "Other Options", and "About". The "Youtube" tab is active. The configuration options are as follows:

- Player Size: 640 \* 385
- Theme: dark
- Auto play:
- Show Controls: auto hide controls and progress bar
- Highlight Color: white
- Disable Keyboard Controls:
- Full screen:
- Loop Play:
- Related videos:
- Modest Branding:
- Update Existing Videos: Update All

A "Save Configuration" button is located at the bottom of the configuration area.

These options can be used to customize the appearance of Youtube video player, once saved it will be applied to any new uploaded videos.

You can use the **Update All** link to upate all existing Youtube videos to have this appearance.

## Work with category

The UVG\_CategoryList module can be used to manage video categories in specific library, it allows you to create individual categories or create bulk categories at same time.

An option in UVG\_Setup module is related to this module:

If this option is enabled, UVG allows you to tell the user roles that can watch videos in this category.

Here is a typical screenshot of the Add Category/Edit Category form:

The screenshot shows a web form titled 'EDIT CATEGORY' with a red header bar. Below the title is a grey bar with the text 'ADD/EDIT CATEGORY'. The form contains several input fields and checkboxes. On the left, there is a text input field for 'Category' containing the word 'Action', a text input field for 'View Order', and a dropdown menu for 'Player Tab' with '<None Specified>' selected. On the right, under the heading 'View Roles', there are four checkboxes: 'Administrators' (checked), 'Translator (en-US)', 'Registered Users', and 'Subscribers' (all unchecked). At the bottom of the form are three buttons: 'Update', 'Delete', and 'Cancel'.

As you can see on the right side, you can choose user roles that can watch videos in this category.

Another option to mention is the **Player Tab**, which defaults to “None Specified”, if this option is set, videos in this category play in the selected tab when clicked. Otherwise they play in the **Player Tab** defined on your **library level**.

UVG 5 allows you to put a video to multiple categories, if a video belongs to more than 1 category, the player tab option is ignored to prevent paradox.

In most case you only use this module to manage categories of specific library, however, if you like, you can use it to build a category list as a quick entry to your video list, you can use display templates to customize its output with these tokens:

- [MODULEPATH] – the path of UVG folder
- [CATEGORYTITLE] – the name of your category
- [VIDEOCOUNT] – number of videos in this category
- [CATEGORYLINK] – the link to UVG\_VideoList module
- [EDITLINK] – the link to edit it

## Work with tags

Tag is keywords which best describe your video, when you add/edit a video you can use our latest Tag Picker to edit tags:

This smart picker allows you to either enter new tags or choose existing tags from auto completion list based on your input. Use Enter or Comma(,) to confirm a tag.

An option in UVG\_Setup module contributes to the tag picker:

When this option is turned on, users without manage permission will not be able to enter new tags, instead he/she can only choose existing tags defined by video managers.

The latest UVG\_VideoList module allows you to use Tags as a filter so you might not use UVG\_TagList any more, however, if you prefer, you can still use it build tag clouds.

## Manage videos

UVG\_MyVideos module allows video authors to manage videos created by him self.

One thing to notice is the UVG\_MySeries module in UVG 4.x is combined to UVG\_MyVideos module, you can find it as a section on left side.

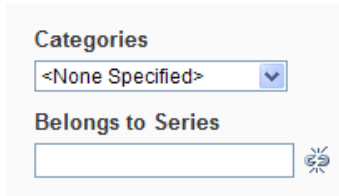

If you have more than 1 library in this portal, users can use the drop down list in top left corner to select the library to work in.

If you have FTP permission, you can upload videos by FTP to corresponding folder and use UVG\_MyVideos module to synchronize it, these videos will be appended to the encoding queue like videos uploaded in UVG\_AddVideo module.

## Work with video series

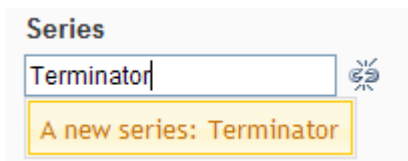

Multiple videos can be placed in a video series so your visitors can watch them together.

When add/edit a video you can see a series option like this:

The screenshot shows a form with two sections. The first section is titled 'Categories' and contains a dropdown menu with the text '<None Specified>'. The second section is titled 'Belongs to Series' and contains an empty text input field with a small icon to its right.

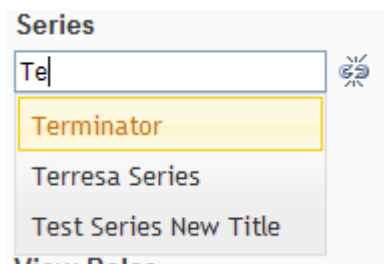

Enter the title of series in the text field, UVG prompts you to create a new series if not exist:

The screenshot shows a form titled 'Series' with a text input field containing the word 'Terminator'. Below the input field, an auto-completion list is displayed with a yellow highlight on the first item, 'Terminator'. The other items in the list are 'Terresa Series' and 'Test Series New Title'. A small icon is visible to the right of the input field.

You must choose the option in the auto completion list to create a new series, otherwise UVG simply ignores it.

If you wish to add this video to an existing series, enter at least 2 characters of the series title, and choose it from the auto completion list:

The screenshot shows a form titled 'Series' with a text input field containing the letters 'Te'. Below the input field, an auto-completion list is displayed with a yellow highlight on the first item, 'Terminator'. The other items in the list are 'Terresa Series' and 'Test Series New Title'. A small icon is visible to the right of the input field.

The icon on right side can be used to detach a video from current series.

When watch a video that is a part of a series, all videos of this series will be displayed in UVG\_RelatedVideos module like this:

---

# Advanced Topics

## Live video recording

UVG 4 is able to record live videos from webcam when work together with Flash Media Server (FMS).

Before using this feature, please be aware there are 3 different versions of FMS:

1. Flash Media Streaming Server
2. Flash Media Interactive Server
3. Flash Media Development Server

Only the 2<sup>nd</sup> and 3<sup>rd</sup> one supports live video recording, the interactive server can be purchased on Adobe's website, the development server can be downloaded for free but it is limited to 10 simultaneous connections, if this limitation is ok to you then you save thousands of dollars.

If you have your interactive server or development server setup, or you use a shared FMS hosting, you can now download the server-side application for live recording from [here](#). Unpack it to get a folder named "uvg", copy this folder to the applications folder of your FMS, which defaults to:

C:\Program Files (x86)\Adobe\Flash Media Server 3.5\applications

Or

C:\Program Files\Adobe\Flash Media Server 3.5\applications

Then you can enter the URL of the server-side application in UVG\_Setup module:

If your FMS does not run in default 1935 port, you can change it or just leave the port number blank.

Another thing to notice is the 1935 port(or other ports used by your FMS) must be allowed in your firewall, otherwise UVG is not able to connect.

Then all settings are done, the record option in UVG\_AddVideo module should now be available:

**UVG\_ADDVIDEO**

**RECORD A VIDEO FROM YOUR WEBCAM**

Your computer doesnot have a webcam.

OK

Duration  
0:00:00

Delete Publish REC

**MORE OPTIONS TO ADD**

- Upload a video**  
Upload from your local computer
- Link a video**  
From a internet URL or Youtube
- Embed a video**  
From a piece of HTML code

Above message is shown when you do not have a webcam, if webcam is available you will be able to use the red REC button to record a video, once finished, click the stop button and finally click the Publish button to publish it to UVG, video are not saved if not published.

## Compact player

Some video websites have a player on their homepage playing their promoted video, this feature is also supported in UVG 5.

Add UVG\_CompactPlayer module to a page, this module looks like UVG\_Player, but it's smaller and more flexible.

**MODULE SETTINGS**

**Player Size**  
320 X 250

**Video Source**  
 Fixed  Dynamic

**First few characters of video title**

In its settings page you can choose either to play a fixed or dynamic video.

When choose fixed video, enter the first 2 characters and choose it from the auto complete list.

When choose a dynamic video, you can use below conditions to tell UVG what kind of video to play:

**MODULE SETTINGS**

**Player Size**  
320 X 250

**Video Source**  
 Fixed  Dynamic

**Condition**  
MostDiscussed

**Timeline**  
a month

**Category**  
<All categories>

## Video listing

UVG 5 allows you to build video lists in many modules, but the main entry is definitely UVG\_VideoList.

The screenshot displays the Ultra Video Gallery 5 interface. On the left, there are three filter sections: 'By Category' with checkboxes for Action, Animation, Comic, Documentary, Science & Fiction, Category 1, and Category 2; 'By Date Added' with checkboxes for months from April 2018 back to February 2010; and 'By Tags' with counts for '3gp (1)', 'abcd (5)', 'adbd (2)', 'adobe (3)', 'funny (1)', and 'kids (1)'. At the top right, there are view options for 'Grid View' (selected), 'List View', and 'Most Recent'. The main area shows a grid of 12 video thumbnails, each with a title, view count, and upload time. For example, the first video is 'Hello Wo' by SuperUser Account, and the last is 'Terresa Series - realplayer' by SuperUser Account.

UVG offers many kinds of filters to help your visitors finding their desired videos, you can optional turn off some of them of all of them.

UVG allows you to switch between **Grid View** and **List View**, which offers 2 different kinds of appearance, as an administrator you can customize the display template of both views.

Below tokens can be used to customize the layout of both Grid View and List View:

[VIDEOTITLE] - Video title, with series title if exist

[VIDEOTITLE] – Video title

[CREATEDDATE]

[DESCRIPTION]

[LINK] - The link to watch this video

[SCREENSHOT]

[SCREENSHOTWIDTH] - The screenshot width set in UVG\_Configurations module

[SCREENSHOTHEIGHT]

[VIEWS]

[VIDEOID]

[CREATEDAGO] - How long ago this video is created

[COMMENTS] - Number of comments

[AUTHORID]

[AUTHOR] - Author display name

[AUTHOR\_USERNAME]

[TAGS]

[LENGTH] - Video length

[CREATEDDATE:Date Format] - Format created date in specified format string

[RATINGSTARS] - Display rating score with star icons

[DESCRIPTION:X] - First X characters in description

[LIKES] – Number of likes

[DISLIKES]

Beside UVG\_VideoList, UVG\_FreeVideoList module can be used to create an incomplete video list with specific criterias, all tokens above are also available in this module.

## Video approval

This option in UVG\_Setup module can be used to enable video approval

Once enabled, videos uploaded by users without manage permission, as defined on library chapter, are marked as “pending”, video managers can use UVG\_PendingVideos module to moderate them.

Please note this is a site-wide option, so once you enable it it affects all libraries of this portal.

## View permission

In default, all approved videos are available to all site visitors, but this can be changed.

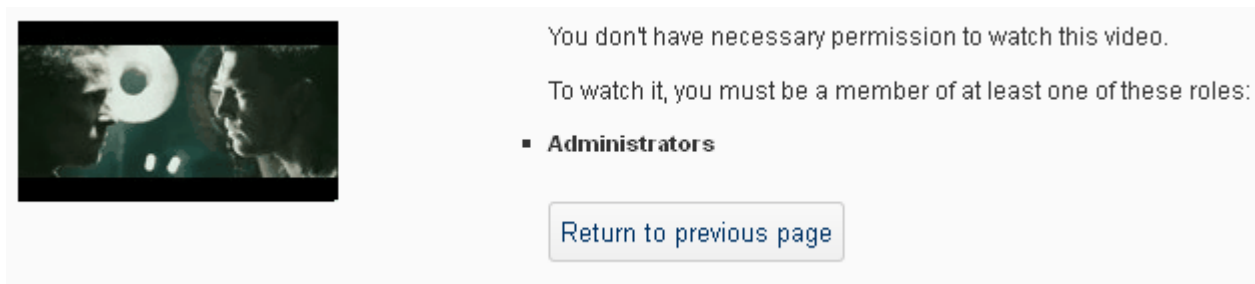

Find these options in UVG\_Setup module:

You can choose one of them or both of them, when enable category view permission, you can define view permissions in Edit Category page of UVG\_CategoryList, when enable video view permission, you can define the permission on Edit Video page of UVG\_MyVideos.

When choose both options above, the setting on individual videos has higher priority.

When a user tries to watch a video without necessary permission, UVG displays this message:

### One-time access URL

A useful feature in UVG 5 is the one-time access URL, which allows a user to watch a video without view permission.

In some case, you wish to give access of specific video to specific user, but this user is not supposed to watch it based on your view permission system, in this case you can edit this video in UVG\_MyVideos module and find this section:

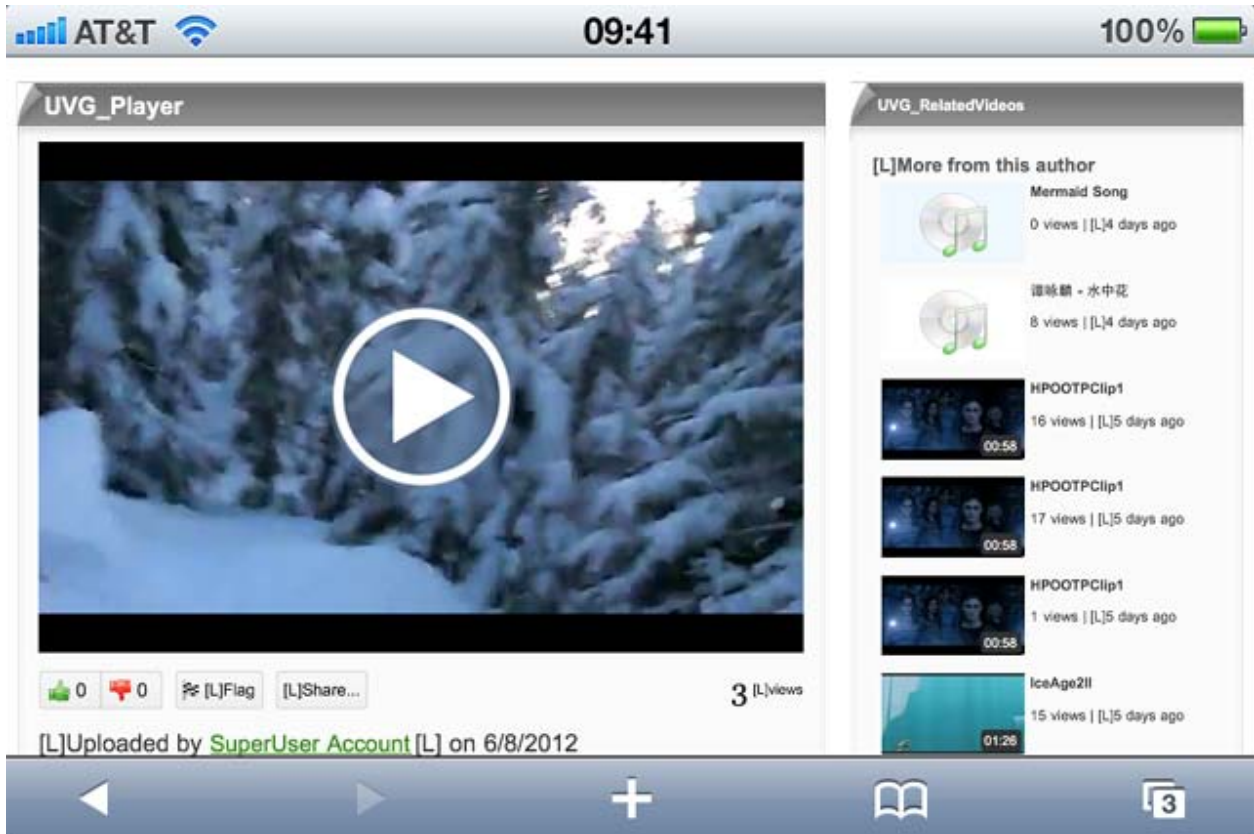

Use the create button to create a one-time access URL, send this URL to the correct user, he will be able to watch it no matter what role he/she belongs to.

The one-time access URL is good for only 10 minuts since first use.

## HTML 5 <VIDEO>

Try to watch a video in UVG with a iPhone/iPad, you will be able to watch it because UVG automatically switch to Html 5 <VIDEO> or <AUDIO> tag:

In default, UVG only adopt HTML 5 tags when the client use iPhone/iPad, you can optionally enable HTML 5 for more browsers if you prefer.

If you are sure a specific browser or device supports HTML 5 <VIDEO> and <AUDIO> tags, you can add the specific character of the browser agent to \DesktopModules\UltraMediaGallery\Texts\Html5UserAgents.txt.

For example, if you wish to adopt HTML 5 for Android devices, simply add Android to the above text file and restart your website.

## Advertisement

UVG allows you to create 4 kinds of commercials/advertisements, all of them are loaded in Our own video player.

If your visitors use iPhone/iPad, UVG adopts HTML 5 player so the commercials are ignored.

Since videos added from embed code are not played in UVG's own video player, commercials are ignored too.

Before creating a commercial in UVG, you should create a **Vendor** first in Admin - Vendors page.

Add UVG\_Commercial module to a DNN page, choose a vendor to see all commercials defined for this vendor, then click **Add** button to add a new item.

### EDIT COMMERCIAL

#### BIZMODULES SOLUTIONS

<p><b>Type</b>  <input type="text" value="Preroll"/> <span style="float: right;">▼</span></p> <p><b>Title</b>  <input style="width: 100%;" type="text"/></p> <p><b>Applies to</b>  <input type="text" value="&lt;All Libraries&gt;"/> <span style="float: right;">▼</span></p> <p><b>Link Url</b>  <input style="width: 100%;" type="text" value="The link of this commercial is optional"/></p> <p><b>File Url</b>  <input style="width: 100%;" type="text" value="The absolute path of the commercial file, in .mp4 format"/></p> <p><b>Audience</b>  <input type="text" value="apply"/> <span style="float: right;">▼</span> this commercial to:</p> <p> <input type="checkbox"/> Administrators               <input type="checkbox"/> Subscribers               <input type="checkbox"/> Translator (en-US)               <input checked="" type="checkbox"/> All Users  <input type="checkbox"/> Registered Users         </p>	<p><b>Stop it When:</b></p> <p> <input type="radio"/> Either end date or max impressions reached  <input type="radio"/> Both end date and max impressions reached         </p> <p><b>Start Date</b>  <input style="width: 100%;" type="text" value="31"/></p> <p><b>End Date</b>  <input style="width: 100%;" type="text" value="31"/></p> <p><b>Max Impressions</b>  <input style="width: 100%;" type="text" value="Enter 0 for unlimited impressions"/></p> <p><b>CPM/Cost</b>  <input style="width: 100%;" type="text" value="Cost of 1000 views, or a flat fee"/></p>
--	---

UVG supports these kinds of commercials:

**Background**, you can display a background picture or flash movie(.swf) in your video player, a valid jpeg picture or swf movie url must be specified in **File Url** field.

**BottomThird**, bottomthird is text advertisement displayed in lower part of the video player when a video is being played, the **Title** field in above screenshot dictates the title of the advertisement, the **Description** field dictates the body of the advertisement, **Link Url** field dictates the link target when click on it, and **Link Text** dictates the label of the hyperlink.

**Preroll & Postroll**, it is easy to understand, these 2 are played before or after your video content, only **File Url** in above screenshot is necessary, which should be a valid url of a .flv/.mp4 video, if the video file is stored within your website, you can ignore the domain name, otherwise you should provide the full path.

**Applies to** dictates the applying scope of this commercial, you can set it to a library or all libraries.

**Conditions** section dictates in which conditions this commercial is active, you can set a start and end date for it, or limit it by setting a max impression number.

Having created your commercials, UVG video player picks specific commercials every time you watch a video, the logic to pick commercials is a bit complicated, below is the basic principle.

Below is a typical screen showing how UVG video player present your commercials.

### **babydance\_0002**

The area between 2 red borders is used to display **Background** commercial, in Module Settings of the player you can set gallery size and player size, if player size equals to gallery size or they are close, there may not be enough place to show background commercial, in this case background commercial is ignored.

The area in green border is used to play your video content, however, **Preroll & Postroll** commercials are played here too, please note the control bar below the video area is disabled when playing preroll and postroll commercials, so your visitors must wait until the commercial is finished.

The area in blue border is used to display **BottomThird** commercial.

UVG add an impression record to database once a commercial is hitted, the record contains impression time, audience name, IP, video being watched ... etc.

When a commercial is finished, e.g. reaches it's date period limitation or max impression number, it's stopped and the status is changed to **Finished** in UVG\_Commercial module.

You can click **Archive** button in UVG\_Commercial module to archive a finished item, related database records are deleted and a CSV report is generated by UVG, which includes the impression and click history of this commercial, you can send this report to your advertiser to show there is no fraud.

## Video quality control

H264 encoding allows you to create video in extremely high quality, in most case you may not need to read this chapter, but if you do wish to adjust the video quality you need to use bitrate manager.

Bitrate Manager is a xml document in UVG used to control the quality of video output, locate BitrateManager.xml in /Desktopmodules/UltraVideoGallery/Binaries folder, open it in a text editor:

```
<bitratemanager>
  <flv mode="Fixed" qmin="5" qmax="15" />
  <mp4 mode=" Dynamic" bitrate="2" />
  <mp4_baseline mode=" Dynamic" bitrate="2" />
  <mpg mode="Dynamic" bitrate="5" />
</bitratemanager>
```

This xml contains 4 nodes: flv, mp4, mp4\_baseline & mpg.

### FLV video quality

The **flv** node is used to adjust quality of flv videos , the **mode** attribute can be either **Fixed** or **Auto**, set it to Auto so UVG handle it automatically, however, if you are not satisfied with the default video quality, set it to Fixed.

When set to Fixed, you must provide an appropriate **qmin** and/or **qmax** value, qmin should be smaller than qmax, the suggested range of these 2 parameters is 1 – 20, please note smaller value means better video quality, so qmin dictates the maximum video quality, and qmax dictates the minimum video quality.

The default setting for this node is qmin = 5, and qmax = 15, you can try to change it to qmin=5, qmax=10 to get better video quality. Please note better quality means bigger file size, you should monitor the file size while increasing video quality. We suggest you to keep qmax >= 10 when use UVG on internet.

### H264 video quality

UVG is not able to directly encode some kind of video formats to mp4 format, for example: Real media(.rm), so sometimes UVG encode it to mpg at first, and then encode it again to mp4 format.

**Mp4** and **Mp4\_baseline** node dictates the video quality of H264-encoded videos, and **mpg** node dictates the video quality of temporary mpg videos.

The **mode** attributes of these 3 nodes can be:

1. Auto

The video quality is determined by UVG

2. Fixed

Use a fixed bitrate, the **bitrate** attribute must be a valid, big number, for example: 800000,

means 800 kbps; 1600000 means 1,600 kbps, if the videos you plan to upload have same or similar resolution, you can use this option.

3. Dynamic

Use a dynamic bitrate determined by the video resolution, the **bitrate** attribute must be a valid, small number, when set it to **2**, UVG encode videos at  $(480*270*2) = 259$  kbps if the video size is 480 x 270, and encode videos at  $(1440*1080*2) = 3,110$  kbps if video size is 1440 x 1080.

For mpg node, it defaults to Dynamic while bitrate is set to 5, this is pretty a large value because we need it to make it clear enough for final H264 encoding.

The default setting for mp4 and mp4\_baseline nodes are Dynamic mode too, yet bitrate values defaults to 2, we suggest you to keep this value between 1.5 ~ 3.

It won't take effect immediately after making changes to bitratemanager.xml, in UVG you should click Restart Application in Host -> Host Settings, in UVG Converter you should quit and run it again.

## Video subtitle

UVG 5 allows you to upload a subtitle for each video in .srt and .vtt format, you can find this feature when edit a video in UVG\_MyVideos module.

.srt is the traditional subtitle format, if you wish to create a subtitle for a video, you may consider to use this online tool:

<http://subtitle-horse.com/>

.vtt format is a part of HTML 5 standard, so if you use subtitles in .vtt format it's expected to work in both UVG and future browsers that fully support HTML 5 standard.

The subtitles displayed in UVG player look like below screenshot.

## Integrate with Amazon S3

Amazon S3 (Simple Storage Service) is an online storage service offered by Amazon. Amazon S3 provides unlimited storage through a simple web services interface. Data can be easily stored and retrieved at any time, from anywhere on the web. Amazon charges in proportion to the amount of data stored and applies charges for sending and receiving data. for further information please refer to [Amazon.com](http://Amazon.com).

Amazon s3 is an ideal choice if you have several GBs of data on your website, band width is becoming more and more expensive today, most hosting providers requires you to buy a predefined disk space and bandwidth usage for data transfer, if you buy 1GB disk space and 10GB data transfer from your hosting company, you pay full price even if you only use 1%.

Amazon s3 is different, it doesn't require you to buy a fixed disk space and data transfer, just use it as you like, you only pay for what you use.

Since version 2.2, UVG is integrated with Amazon s3, you can benefit from it by going through our S3 integration wizard.

Find Amazon S3 config link in UVG\_Setup module:

Step 1

Step 2

Step 3

[L]The scheduler to upload local videos to amazon s3 server is not installed, click Finish button to install it.

Step 4

In the 1st step, you should provide your amazon access key, if you don't have one please login to [Amazon.com](http://Amazon.com) and sign up for simple storage service, then you will have a pair of key id and secret key.

In the 2nd step, you should create a "bucket" to store your files, in the simplest manner, you can consider "bucket" as internet domains, all of your files can be accessed as [http://bucket\\_name.s3.amazonaws.com/file\\_path](http://bucket_name.s3.amazonaws.com/file_path), please note bucket name is unique across all of

Amazon S3 so you won't succeed if you use common words as your bucket name.

In the 3rd step, you can adjust batch quantity if necessary, in default, UVG transfer only 10 videos to Amazon each time.

In the 4th step, UVG informs you the scheduler is not installed and you can install it by clicking the Finish button, once installed, you can find it in Host - Schedule, this task runs every 24 hours, if you want to change its next start time, for example, to run in the midnight, you can run this query in Host - Sql:

```
{databaseOwner}{objectQualifier}UVG_SetAWSOperationTime HOUR, Hour is a integer value between 0 to 23.
```

Having finished this wizard, UVG takes the rest, your videos, screenshots will be transferred to Amazon every day, once a video is successfully transferred, it is deleted from your server hard disk.

It may take a few hours to transfer a batch if your videos are big, to know how many videos have been successfully transferred, you can run this query in Host - Sql:

```
Select count(*) from {databaseOwner}{objectQualifier}UVG_Video where AWS_ThumbKey<>"
```

When you delete a video, UVG contact amazon s3 server to delete related files so it doesn't waste your disk space.

If you have more than 1 portals in your DNN installation, videos in different portals can be transferred to different buckets on amazon, to configure this, you should run Amazon S3 Integration wizard in each of your portal.

### **CloudFront support**

Have you ever experienced this situation? Your web server is hosted in a data center in the US, visitors from north america can watch your video content fluently, but peoples from other continents may continuously buffer and buffer.

Amazon CloudFront service allows you to delivery large amount of data to visitors around the world with a global network, when the visitor comes from the US, a server in north america will serve the request; when the visitor comes from Japan, a server in Tokyo will serve the request; when the visitor comes from Berlin or London, a Europe server will serve the request, so you can expect to deliver your video content to global users as fast as possible.

For further information please refer to [Amazon](#). Especially you should read the [Getting Started Guide](#) to know how to manage CloudFront distributions.

CloudFront integration is available in UVG since 3.0.5, to use it is quite simple, at first, use CloudFront Manager to create a distribution for your bucket, you'll get a distribution name.

Then locate /DesktopModules/UltraVideoGallery/Texts/CloudFront.txt on your website, open it with a text editor, simply map your bucket name and distribution name like this:

Bucket Name -> Disctrubution Name

If you have 2 buckets, the 1<sup>st</sup> bucket is "uvgvideos", the corresponding distribution name is "d1vrk8tesw8yga", the 2<sup>nd</sup> bucket is "uvgvideos\_subportal", the corresponding distribution name is "d3kro2xelq3oql", your CloudFront.txt should looks like this:

uvgvideos -> d1vrk8tesw8yga

uvgvideos\_subportal -> d3kro2xelq3oql

Save changes and run Restart Application in Host Settings, then UVG will redirect http request to your amazon bucket to CloudFront distribution.

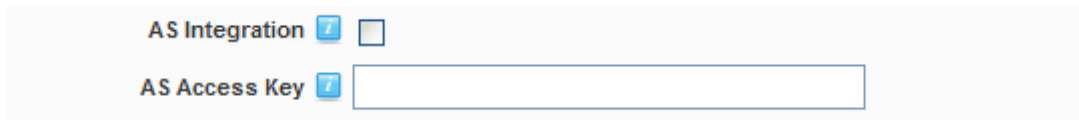

## Integrate with other products

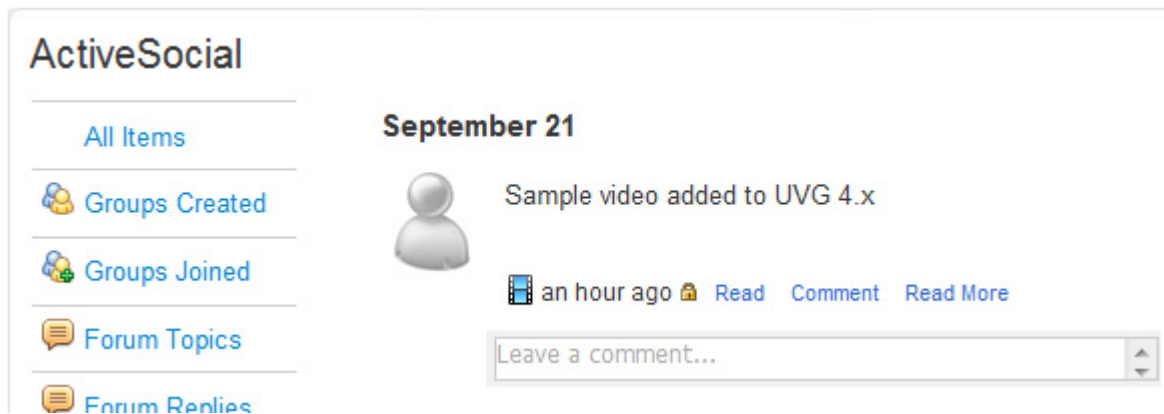

### Notify Active Social when add a video

UVG is able to notify Active Social 1.8+ when a new video is added, but under default configuration Active Social doesnot show video events in its summary module, you must manually enable it in active social's control panel -> Journal -> Available Journal Types. Then you can click "Videos" in this section to create an access key for UVG.

In UVG side you need to turn on the integration and tell UVG the access key, related settings can be found in UVG\_Setup module:

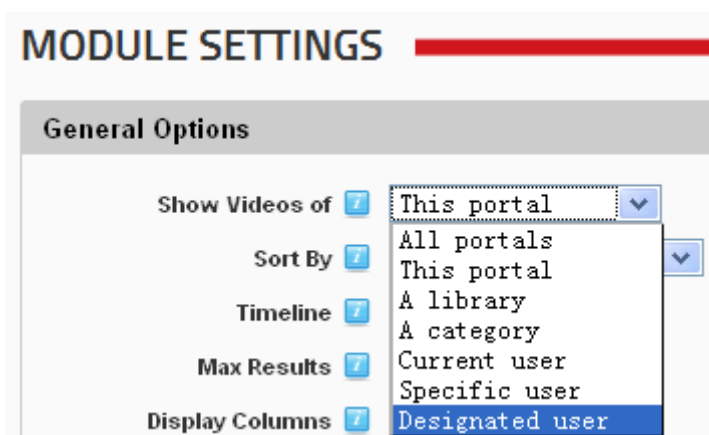

Then once a new video is added you can see it in active social like this:

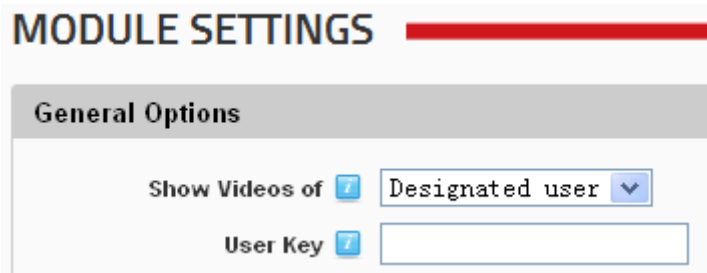

### Integrate with profile modules

If you use any profile module that includes user id in the URL when view one's profile, UVG is able to show videos from this user.

To do the integration you can use either UVG\_MediaCenter or UVG\_FreeVideoList module, in the settings page you can set the scope:

Select **Designated user** from the scope selection, then you can see a **user key** option like this:

**MODULE SETTINGS**

**General Options**

Show Videos of

User Key

User Key is the name of the parameter in URL which represent user id, it could be simply userid or something else.

Properly configure the user key, then videos from this user will be displayed when you view one's profile.

## **Work with other video formats**

The video encoding engine in UVG can serve a lot of video formats, even that are not publicly advertised, for example: VCD video with .dat extension and High Definition video with .ts extension

You can try to upload your video in other formats to see whether it can be supported by UVG, however, you must allow this kind of extension in Host Settings before upload it. For example, if you want to upload a VCD video, please login with host and ensure .dat extension is included in Host Settings -> Advanced Settings -> Other Settings -> File Upload Extensions box.

## Localization guide

UVG support complete localization, to localize it please follow these steps.

### **Localize language resource file for .net controls**

Like other DNN modules, the language resources for .net controls are saved in App\_LocalResources folder, please refer to DotNetNuke manual for detailed information about how to localize them.

### **Localize language resource file for flash player**

in /DekstopModules/UltraVideoGallery/Swf\_Resource folder, you can find a xml file named "uvg.swf.xml", this file is the resource file used by our flash player, please make a copy it, and rename the copied version to uvg.swf.<your locale>.xml, for example, if you use German you should rename it to uvg.swf.de-DE.xml, then open this file in an xml or text editor, you can find a lot of key=value pairs, just translate all values to your own language.

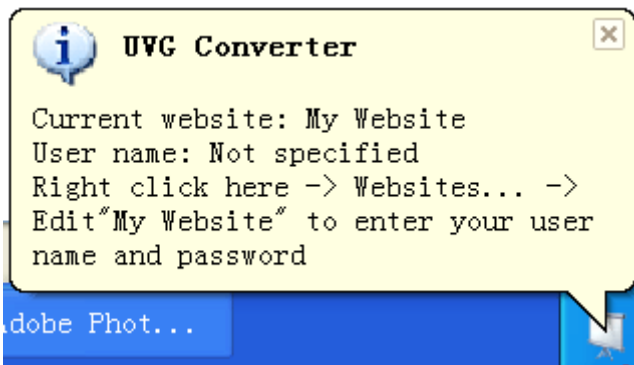

# UVG Converter

## Overview

UVG Converter is the client tool for Ultra Video Gallery, in version 1.x and 2.x, it's designed as a complementary tool for users who are not able to pass the permission check, in version 3 it's fully redesigned and redeveloped. We suggest you to use it even you are able to pass the permission check because it's powerful and easy to use.

Click [here](#) to download it, please note UVG Converter depends on .NET framework 2.0 support, if it isn't installed on your computer you will be required to install it first.

Run it after successful installation, UVG Converter minimize to system tray like this:

UVG Converter 3 doesn't have a main window; all functions are available through its right mouse menu:

## Register your website

Before using UVG Converter, you should register your website first, so UVG Converter know where to upload your videos.

Right click UVG Converter icon -> Websites... -> Edit "My Website", you will get the edit website window

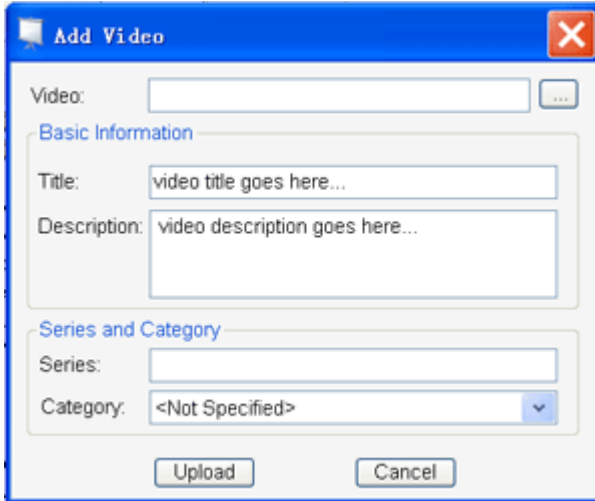

The image shows a standard Windows-style dialog box titled "Edit Website". It features a blue title bar with a close button (X) in the top right corner. The main area contains the following fields and controls:

- Site url:** A text input field containing "http://www.mydomain.com".
- Portal:** A dropdown menu with a downward-pointing arrow.
- User name:** An empty text input field.
- Password:** An empty text input field.
- Verification:** An empty text input field with the text "if necessary" to its right.
- Buttons:** Three buttons at the bottom: "Save", "Delete", and "Cancel".

You can register multiple websites in UVG Converter, but only 1 website is active, click your website name in right mouse menu -> Websites... to make it active.

## Add videos

Click **Add Video** from UVG Converter right mouse menu to add a video:

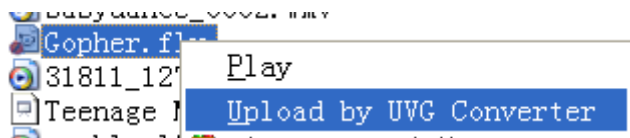

The 'Add Video' dialog box features a blue title bar with a close button. It includes a 'Video:' field with a browse button, a 'Basic Information' section with 'Title:' and 'Description:' fields, and a 'Series and Category' section with 'Series:' and 'Category:' fields. The 'Category:' field is a dropdown menu currently showing '<Not Specified>'. At the bottom are 'Upload' and 'Cancel' buttons.

UVG Converter divide encoded files to multiples pieces and upload them one by one to prevent timeout error.

Since UVG Converter only uploads the encoded file rather than the original file, it's supposed to be much faster and efficient.

You can configure UVG Converter to appear in the right mouse menu of your videos files like this:

## Advanced features

In the Options screen, you can find **Silence mode** and **Watch folder** option, which may be quite useful.

You can set a folder on your local disk as watch folder, as long as a new video is placed in this folder – no matter it's placed manually by your self or a program - UVG Converter Add video window appears asking you to add this video.

When Silence mode is enabled, UVG Converter Add video window doesn't appear when there is a new video in watch folder, but UVG Converter add this video to your website without asking you, you get notification in the system tray like this:

## **Thank you**

If you have not yet purchased Ultra Video Gallery, please visit:

<http://www.bizmodules.net/Buynow/tabid/101/Default.aspx>
