## 1. Features

The Easiest and Fastest way to E-mail Voice Messages and Music  
Records and E-mails your Voice Message with the Touch of ONE Button  
Perfect for voice recognition  
Powerful MP3 sound compression

## 2. Technical specification

### Microphone

Omni-directional condenser  
Type of recording: mono  
Sensitivity: - 40dBV/Pa  
Frequency: 50 - 16000Hz (+/- 3db)  
ADC resolution: 16 bit  
Sampling rate: 48 kHz  
SNR: 83dBA (1kHz at -20dB)  
THD: -80dB (1kHz at -3dB)

### Headphones

Frequency: 50 – 20000Hz (+/- 3db) \*  
Type of playback: stereo \*\*  
DAC resolution: 16 bit  
Sampling rate: 48 kHz  
Output power: 60mW (per channel)  
THD+N: -46dB (50Hz-20kHz, 40mW) \*\*\*

### Notes:

\* 200 – 10000 Hz for EPH-USB model  
\*\* mono for EPH-USB model  
\*\*\* - 44 dB (200Hz-10kHz, 40mW) for EPH-USB model

### Plugs

USB A-type male

## 3. System requirements

### For PC:

Pentium 133 MHz processor or higher  
USB 1.1 port  
OS Windows 2000/XP/2003/Vista

### For Macintosh:

PowerMacintosh G4 or better  
USB 1.1 port  
MacOS 10.3 or later

## 4. Quick installation

### 4.1 Hardware installation

- Connect the USB plug to the computer.

### 4.2 Software installation

For PC:

- Insert the EHSMonitor software CD into the CD drive.
- Providing autorun is enabled the CD will begin automatically.
- if it does not: Press Start/run/ browse/ - The drive where the CD can be found.
- Double click on the file named eMic4all\_Setup – and follow the instructions shown.

For Macintosh:

- Insert the EHSMonitor software CD into the CD drive.
- On the pop-up window which will appear, find EHSMonitor pkg and double click on it.

## 5. E-mail headset control box functions

Control box has 2 buttons  (“Microphone”) and  (“Ear”) and headphones volume control . The actual function of each button is determined by the software driver (EHSMonitor). The volume control is used to adjust the hardware loudness of the headphones. It has no influence on the system software volume control.

## 6. EHSMonitor software manual

### 6.1 Software overview

#### 6.1.1 EHSMonitor

With EHSMonitor it is possible using only one button to record file, save it, convert to MP3 and even to generate an e-mail message with the recorded file attached or upload record to web server.

#### 6.1.2 LAME MP3 encoder

MP3 is a format for compressed audio storage. MP3 uses psychoacoustic filters to remove sounds that are inaudible to the human ear, as well as other methods to compress the audio information. Thus there could be discernable difference between the original and encoded audio data (a great depends on the encoding parameters). Modern MP3 encoders are very flexible and allow you to set a lot of parameters, affecting the encoding speed and the output file quality. EHSMonitor uses LAME as default encoding engine. LAME is quite fast (encodes faster than real time on a PII-266 at highest quality mode) and provides a very good sound quality. For more information, please visit LAME official site at <http://www.mp3dev.org>. If for one or another reason you do not like LAME, you can use any other MP3 encoder that supports command line interface. See “**Advanced settings**” section for details.

### 6.2 E-mail microphone recording

#### 6.2.1 Recording

E-mail headset allows you to record and E-mail sound files by pressing only one button. The rest (MP3 encoding, generating of the eMic-message, uploading it to the eMic4all server etc.) will be done for you automatically. Recording is always first made to a temporary file. Thus, even if the recording is finished abnormally (power failure, etc.) the recorded data would not be lost (however such file would not be recovered automatically). It is possible to assign one of five pre-defined functions to any of the microphone buttons (since it is assigned, it becomes a function of E-mail headset). That means that it is even possible to assign the same function to the both E-mail headset buttons. There are two ways to use the E-mail headset buttons:

**Hold down.** Recording starts right after the button is pressed down and lasts while the button is held pressed. When the button is released, recording stops.

**Click.** Recording starts after the button is pressed and consequently released. Recording stops when the button is pressed for the second time. Recording can be paused and resumed as many times as needed by pressing and releasing the button different from the one that has started the recording.

The five pre-defined functions are:

**Rec.** If MP3 recording option is set the recorded file is encoded to mp3 file format.

**Rec and Attach.** After the recorded file is saved (and encoded if necessary), an e-mail message is generated with the recorded file attached. It just remains to specify the recipient and send the message.

**Rec and save to specified file or MEMO function.** When the recording is finished, EHSMonitor prompts you for the recorded file name. If specified, the recorded file is encoded to mp3 file format.

**Rec and upload to eMic4all server.** Encoding to mp3 and uploading to the server is being processed during the recording. After the recording is finished the link to the eMic-message on the server is generated and immediately pasted into the window that had input focus at the beginning of the recording.

**Note:** Rec and upload function is available for the Wav and normal quality Mp3 recordings only.

**Note:** Normally by default a defined by you text (prefix) precedes the link to the eMic-message. If the prefix text is not required (which e.g. can be useful if you intend to insert the link into Excel file or database) push the **Shift** key just prior to the moment when you start the recording.

**Rec Skype/MSN.** Records Skype, MSN, Windows Live Messenger or other VoIP software voice conversations. During the eMic installation Skype and MSN will be automatically configured for this function to work. If you install Skype/MSN after the eMic or if you use a different VoIP software for the voice communication, make sure that the virtual device named *eMic Audio Filter 1* (Windows XP) or *Line 1 (eMic Audio Filter)* (Windows Vista) is selected as the input microphone and the virtual device named *eMic Audio Filter 2* (Windows XP) or *Line 2 (eMic Audio Filter)* (Windows Vista) is selected as the output sound device in the settings of the Skype/MSN/VoIP software.

**Note:** **Rec Skype/MSN** function is available for Windows XP and Windows Vista only.

**Undefined (Unused).** The button will not be used by the EHSMonitor software. This can be helpful if some other software uses this button.

**Filter.** With this option set, before the eMic-function is executed the selected sound filter will be applied to the recording. Use **Sound editor** to edit and create your own sound filters.

**Note:** **Filter** option applies to the currently selected pre-defined function.

**Sound editor.** With this option set, before the eMic-function is executed the **Sound editor** will be launched. With the help of the **Sound editor** you will be able to listen to your recording and edit or amend it if necessary.

**Note:** **Sound editor** option applies to the currently selected pre-defined function.

**MMAB.** With this option set, every time creating an e-mail with **Rec and attach** eMic-function you will be offered to choose the recipient from multimedia address book.

**Note:** **MMAB** option applies to the currently selected pre-defined function.

Note for Windows version: All settings changes come into force only after the “Apply” button at the bottom of the dialog box window is pressed.

## 6.2.2 Managing recordings

After the recording has been finished, the recorded file name is saved in the list of all recorded files. EHSMonitor allows to change the file name or location (the file will be renamed and moved if necessary), to delete one or more files or to generate an e-mail message with one or more previously recorded files attached. See “**Recording manager**” section for details).

## 6.3 General settings

### 6.3.1 One-touch recording options

**Save recorded files** Specifies the folder where the recorded files will be saved to. You can select any existing folder. **Wav/Mp3/HQ Wav/HQ Mp3** radio button. You can also select one of the four formats to save the recorded data.

“HQ Wav” and “HQ Mp3” formats has higher sound quality than “Wav” and “Mp3”, but less compact file sizes (by a factor of 2 and 1,5 respectively). Formats are described in the table below.

Table 1. Audio file formats.

Designator	Audio file format
Wav	Wave PCM, 11,025 kHz 16bit mono

Mp3	MPEG Audio Layer-3 16kBit 11,025 kHz
HQ Wav	Wave PCM, 22,050 kHz 16bit mono
HQ Mp3	MPEG Audio Layer-3 VBR 8-24kBit 22,050 kHz

### 6.3.2 Button A/Button B function

E-mail headset has five different functions. Any function could be assigned to any of the buttons; it is even possible to assign the same function to both buttons. See “**E-mail microphone recording**” section for details.

### 6.3.3 Launch at Windows startup (Launch at user login)

If this option is set the EHSMonitor will start automatically whenever the Windows is started (on user logon for Macintosh users).

## 6.4 Advanced settings

### 6.4.1 External MP3 encoder

By default EHSMonitor uses LAME encoder to encode to MP3 and the default format is CBR 16Kbps, 11025 Hz, 1 channel (mono). If you would like to change from LAME or if you want to specify the custom encoding parameters, you can choose any other encoder (here and later - external encoder) you like. There is only one requirement: the external encoder should support command line interface, i.e. it should be possible to use it from the command prompt.

**Use External MP3 encoder** By checking this check box; you can make EHSMonitor use any external command-line MP3 encoder instead of the default encoder.

**Path to executable** Specify the full path to the external encoder executable file. You can enter the path manually in the edit box or browse for the file. If the invalid path is specified in this field, EHSMonitor will attempt to use its own encoder. If for some reasons the built-in encoder cannot be used as well, then the file will be saved to the same folder and with the same name but in the “wave” format (and with .wav extension). So, whatever happens, your recording will not be lost.

**Additional parameters** Specify any additional parameters, supported by the external encoder. These parameters are passed directly to the encoder exe-file without any check if the external encoder really supports the specified parameters.

Generally, the external encoder call string should satisfy the following template:

```
<full path to encoder> <additional options> <full path to source file> <full path to destination file>
```

Parameters are described in the table below.

Table 1. External MP3 encoder parameters.

Full path to encoder	The full path to the external encoder executable file.
Additional options	Any additional options.
Full path to source file	Full path to the source wave file. Supplied by EHSMonitor. User does not have to care about this path.
Full path to destination file	Full path to the destination mp3 file. If supplied by EHSMonitor, it is always valid. If this path is supplied by the user, the user is responsible for validity of this path.

**Warning!** If encoding fails due to the invalid path to the destination file, or due to the invalid additional options (not supported by encoder), the original recorded wave file will be deleted. Unless you are able to supply the correct external encoder parameters, it will not work. In general it is quite enough to use the LAME encoder, supplied with EHSMonitor.

### 6.4.2 File name format for one-touch recording

Names for the files recorded with one-touch recording are generated automatically based on the user-defined template. The generated file name looks like this:

```
<Prefix><Random number>.<extension>
```

Parameters are described in the table below.

Table 2. File name format parameters.

Prefix	An arbitrary string. This string can't include system characters (such as backspace character, new line character, etc.) and any character from the following set: <> : " / \  .
Some	This is the part of the file name, which makes files different from each other. This number can be

number	generated in two ways. <b>Date/Time based</b> – the generated number represents date and time when the recording is finished, using the following template <i>YYYYMMDDhhmmss</i> , where letters "YYYY", "MM", "DD", "hh", "mm", "ss" represent current year, month, day, hour, minute and second respectively. <b>Enumerated</b> – numbers are generated consecutively, i.e. the generated number is the least not used number (there is no file with the same filename), starting from zero.
Extension	File extension. "Wav" or "mp3" depending on the selected file format.

### 6.4.3 Advanced recording options

EHSMonitor sets the minimum recording time. This means, that any recording, that lasts less than minimum recording time is discarded. This can be useful to eliminate recordings caused by accidental EHS button pressing. By default the minimum recording time is 1 second. The minimum recording time can be any number in the range from 1 to 262144 (3 days 49 minutes 4 seconds). The maximum recording time is limited only by the available hard disk space.

### 6.4.4 Address book options

**Use multimedia address book.** When this option is checked every time creating an e-mail with EHSMonitor using **Attach selected files** button you will be offered to choose the recipient from multimedia address book. Use **Edit...** to run Multimedia address book editor to form list of contacts.

**Note:** Any changes made to this setting will take effect only after the current recording is finished (if any).

## 6.5 eMic4All account settings

### 6.5.1 Account options

To be able to use the **Rec and upload** E-mail headset function you have to be logged in to an existing account on one of the eMic4all servers.

**Upload records to server.** Select or enter the URL of the server where you already have an account to login to or of the server where you wish to create a new account. After the login all the messages generated by the **Rec and Upload** function will be automatically stored on the specified here server.

**Login.** Enter your login of an existing account here.

**Password.** Enter your password of an existing account here.

Press **Login** button to login to existing account or **Register** button to create a new account on the specified server. When you are logged in, the **Profile** button is enabled. Use it to view and change your account settings.

### 6.5.2 Registration

Please fill in the registration form to register the new account. The serial number can be found inside the package or at the bottom of the product.

The trial registration allows creating the trial (valid for 30 days) account without serial number if the serial number is missing or invalid.

**Note:** Only devices supplied with EHSMonitor software version 2.0 or later can be accepted for registration.

**Note:** Trial account requires activation, activation instructions will be sent to you by e-mail.

### 6.5.3 Subscription upgrade

There are two ways to upgrade your account. The first is to do it on the eMic4all server in your account profile. The second is to get a new subscription with the new eMic. Note that the users of eMic-S, EPH-USB or EHS-OFFICE get the **Basic** subscription free of charge. If you decide to purchase eMic-PRO or EHS-USB later on, you will be entitled to get the **Advanced** subscription free of charge. To upgrade the existing account with the **Basic** subscription to the **Advanced** subscription, please click the **Upgrade** button and enter the new product serial number when required to do so.

### 6.5.4 Upload options

**Link prefix.** The text entered here will precede a link to the eMic-message and pasted to the currently open document.

**Insert new line.** Select this option to insert a new line automatically after the link to the eMic-message is pasted in the currently open document.

**Preview.** With this option chosen whenever you create a message by **Rec and upload** function the **eMic-message properties** window will appear. It will allow you to change the appearance of the eMic-message on the server, listen to the recording and edit it.

**Note:** if **Preview** option is selected the link to the eMic-message (with eventual prefix and new line) will not be pasted automatically into the document in the active window. If you wish to paste the link, press **Copy link** button in the **Upload properties** window.

**Note:** even if **Preview** option is not selected an icon  will appear in the system tray for one minute after the recording is finished. Double-click on this icon to launch the **Upload properties** window.

**Note:** if by the time you finish the recording the document in the active window does not accept entering of the text, the link to the eMic-message will not be inserted there. However the whole link will be stored in the Clipboard. Use Paste function (Ctrl-V) to place the link wherever you wish to.

## 6.6 Recording manager

### 6.6.1 Recording manager

EHSMonitor maintains the list of all recorded files and links to their remote copies stored on the eMic4all server. If the eMic-message has a title it is also displayed next to the file name. Any time you make a new recording the recorded file is added to the list. Uploaded records are marked with a special icon . Using the recording manager you can manage your recordings: rename them, generate e-mail messages with one or more recordings attached to them, upload records to the eMic4all server, delete recorded files or their remote copies on server, you can also edit your records using the **Sound editor** including updating stored on the server eMic-messages and their appearance.

To generate an e-mail message with some recordings attached or to delete some recordings, select them in the list and click **Attach selected files** or **Delete selected files** button respectively.

To edit a record, no matter uploaded or not, click **Edit** button. If for the currently selected record there exists an eMic-message uploaded to the server, **eMic-message properties** window will appear.

Click **Copy link** button to copy a link to the uploaded eMic-message to the clipboard.

You can click **Upload** button on the locally made record to create an eMic-message on the eMic4all server.

Use **Refresh** button to update status of the selected records. If the eMic-message cannot be found on the eMic4all server a special icon  will disappear from the record row. The eMic-message titles will also be updated from the server.

To rename a certain recording, select it in the list, click on it and edit the file name (location).

The double click on the file in the list will cause this file to be played or opened by the default application that is assigned to handle this file extension. In fact the double click on the file will have the same effect as executing this file from the Windows Explorer.

**Note:** it is also possible to play back the records from synchronization window.

### 6.6.2 Synchronization

To synchronize all locally stored files and the eMic-messages on the server press **Sync** button. This button will update all the titles of the eMic-messages. In addition to it a synchronization window will appear when:

- one or more records which are supposed to be on the eMic4all server but cannot be found there (so probably need to be uploaded again)
- one or more records which do exist on the eMic4all server but the local copy is missing (so probably need to be downloaded again)
- one or more records which cannot be found neither on the eMic4all server, nor locally (such records have to be removed).

The synchronization window is intended to help you keep your recordings synchronized with the eMic-messages on the server.

The three first columns in the table indicate which action should be taken with the “troublesome” record. At the same time the icons in the first two columns show the status of the local record and of the eMic-message.

The green tick  in the first column means that the locally stored record has been found. The empty space in the first column means that the locally stored record on the server is missing.

The green tick  in the second column means that the eMic-message record on the server has been found. The empty space in the second column means that the eMic-message record on the server is missing.

You can specify the action to be taken with each record. The possible actions are:

1. Upload local record to the server – represented by the symbol 
2. Download the record from the server – represented by the symbol 
3. Delete the record – represented by the symbol 

When the window is opened for the first time the system by default selects the most logically correct action for each record. This default action can be changed by clicking on the cell.

All the actions will be performed immediately after you press the OK button.

## 6.7 Troubleshooting (Solving problems)

Common problems and solutions:

- **External MP3 encoder does not work**

The external MP3 encoder call string is the following:

```
<executable name> <additional parameters> <full path to source file> <full path to destination file>
```

Be sure that your encoder would accept this string.

## 7. Multimedia Address Book utility

### 7.1 Overview

**Multimedia Address Book** application has the following main features:

- Can be used with EHSMonitor software. Use Multimedia Address Book for selecting the recipient of the e-mail with your voice recording. Refer to EHSMonitor Help file for details.
- Provides easy access to Multimedia address book contacts.
- Allows postponed e-mail sending using the default mail client interface.
- Supports immediate e-mail sending through the specified SMTP server (no mail client required).

### 7.2 Multimedia Address Book Contacts file creation

Before using Multimedia Address Book create a list of contacts using Multimedia Address Book Editor. Refer to Multimedia Address Book Editor Help file for details.

### 7.3 Navigating through Contacts and Selecting Recipient

Multimedia Address Book allows selecting one recipient of the contacts list to deliver your e-mail to. It is also possible to create an e-mail with no recipient (only with mail client interface) by pressing No recipient button. In this case the recipient has to be specified in the mail client interface by typing it or selecting from the default mail client address book. Entries of the Contacts list are initially shown in the alphabetical order, with the only exception of Default recipient which is always shown first. To navigate through the Multimedia Address Book Contacts you can use mouse wheel, Multimedia Address Book user interface buttons or E-mail headset “Microphone” button. Type first characters of the recipient name or e-mail address in the Recipient filter box to filter the displayed Contacts. To select the recipient double click the mouse left button on its picture or press enter key when the picture of the recipient is highlighted with the green frame. You can also press E-mail headset “Ear” button to select the currently chosen recipient.

Note: Refer to Multimedia Address Book Editor Help file to learn how to specify the Default recipient.

## 7.4 Settings

**Send to default recipient.** If this option is on then the e-mail created using **EHSMonitor** will be sent to the Default recipient automatically and immediately. In this case Multimedia Address Book window will not be shown.

**Note:** Refer to **Multimedia Address Book Editor** Help file to learn how to specify the **Default recipient**.

**Send through SMTP server immediately.** Use this option to send e-mails with Multimedia Address Book directly through SMTP server using your e-mail account. No mail client is required in this case. Enter SMTP server address in **Outgoing mail (SMTP) server** field, enter your name and e-mail address, check **SMTP server requires authentication** and specify **Server logon options** if necessary. The message will be then sent directly through the SMTP server.

**Note:** the Subject field of the e-mail in this case will be filled with **Subject prefix** followed by time stamp, using the template [DD. MM. YYYY hh:mm:ss], where letters "YYYY", "MM", "DD", "hh", "mm", "ss" represent current year, month, day, hour, minute and second respectively. The sender of such E-mail can be specified in the **E-mail account options**.

Use Outgoing mail (SMTP) server port number field to change the server port number.

## 7.5 Troubleshooting

Possible reasons of being unable to send an e-mail.

If you are trying to send an e-mail using your default mail client (Send through SMTP server immediately option is switched off):

- Check if one of the supported mail clients (MS Outlook, Outlook Express, Lotus, Mozilla Mail, Netscape) is installed on your computer and used as a default mail client.

If you are trying to send an e-mail directly through SMTP server (**Send through SMTP server immediately** option is switched on):

- Check your Internet connection.
- Check the following Multimedia Address Book settings:
  - Check if your SMTP server is specified correctly.
  - Check if the server logon options are specified correctly, if your SMTP server required authentication.
  - Contact your system administrator to verify the outgoing mail server port number.

## 8. Multimedia Address Book Editor utility

### 8.1 Overview

**Multimedia address book editor** is a utility tool intended to fill and update the multimedia address book, which can be used with the **EHSMonitor** software. When **Use multimedia address book** option is switched on, whenever you create an e-mail using **EHSMonitor** the **Multimedia Address Book - Contacts** dialog appears and helps to choose the message recipient without typing. To make navigation through the list of Contacts easier each contact is coupled with an image and/or sound.

### 8.2 Editing Contacts list

Use **New contact** button to create a new contact. Select any existing contact from the list to edit its attributes. In addition to the standard **Name**, **E-mail** and **Phone** attributes MAB Editor allows to assign an image and/or a sound to any contact. You can select one of the images from the supplied image collection or use your own picture (**BMP, JPG, GIF** graphics formats are supported). Browse for an appropriate **Wav** or **Mp3** file on your computer to assign it to the contact. Use **Save** button to save changes.

Press **Default** button to make from the currently selected contact the **Default recipient**. **Default recipient** is shown as first in the **Multimedia Address Book - Contacts** dialog for quicker access. Refer to the **Multimedia Address Book** help file for details of using **Default recipient**. Use **Preview** button to open the **Multimedia Address Book - Contacts** dialog with the updated Contacts list.

**Hint:** Use **Rec** or **Rec and Save to file** options in the **EHSMonitor** software to create audio files, which can later be assigned to the Multimedia address book entries.

### 8.3 Multimedia Address Book Contacts file

All Contacts information is stored in a single file associated with the Windows® user.

**Path to address book file** shows the current address book file location. Use ... button to open a different existing address book file or to create a new one by typing a new file name.

## 9. Sound Editor utility

### 9.1 Overview

**Sound editor** application has the following main features:

- Can be used with **EMicMonitor USB/EHSMonitor/EMicMonitor Pro** software to process voice recordings before sending them by e-mail (uploading to the eMic4All server). Refer to **EMicMonitor USB/EHSMonitor/EMicMonitor Pro** Help file for details.
- Allows editing sound audio files of .wav and .mp3 formats.
- Performs MP3 encoding using LAME MP3 encoder.
- Performs conversions of .wav to .mp3 audio file format and vice versa.

Provides sound recording capabilities.

### 9.2 Editing audio files

To edit an existing audio file please, follow the steps below:

- Use **Open...** command from the **File** menu to open an existing file. Sound editor supports audio files in Wav and MP3 audio formats.
- Use **Play** and **Stop** buttons or just click over the blue bar to navigate through the sound file. The yellow marker shows the current position in file.
- Use **Mark** button to set one of two red markers in the specified location.

Note: You can change the red and yellow markers position by dragging them with your mouse along the time scale. Drag the marker somewhere outside the time scale to remove it.

Note: The playback always starts from the yellow marker and stops by the red marker. To resume the playback, click the Play button again. This is specially made so to let you set the precise mark between the sound fragment you'd like to keep and the one you wish to delete or overwrite.

- If you would like to delete a piece of the recording, first place one of the red markers at the start of the fragment you'd like to remove and then place the other red marker at the end. Press the **Delete...** button to remove the marked fragment from the recording.
- To insert an additional voice recording into the file at the specified position (where the single red marker is) use E-mail headset "Microphone" (Hold down) and "Ear" (Click) buttons in the usual fashion.

Note: insertion is not allowed if both of the two red markers are in place.

- There are three ways to insert the new recording into the existing file:
  - **Insert at marker** - inserts at current (red marker) position, the whole file gets bigger.
  - **Overwrite** - overwrites the file starting from the red marker.
  - **Continue from marker** - replaces the rest of the file from the current (red marker) position with the new recording.

Please, choose the appropriate setting from the **When recording** combo box.

- If you wish to save the amended audio file please, use **Save** and **Save As...** commands from the **File** menu. Using **Save As...** you can also convert audio files from Wav to MP3 formats or vice versa if required.

**Note:** the E-mail headset buttons to start the new recording will work only if the Sound editor window is active, otherwise the device buttons will not work with the Sound Editor.

**Note:** if the opened file was originally compressed to MP3 then it will be saved with the same MP3 encoder settings and quality by either **Save** or **Save As...**

**Note:** Encoding Wav files to MP3 format is processed using **Normal quality encoding** or **High quality encoding** settings.

## 9.3 Creating new audio files

To create a new audio file please, follow the steps below:

- Use **New** command from **File** menu to create an empty audio file.
- To start recording please, hold down E-mail headset “Microphone” button or click E-mail headset “Ear” button.

**Note:** recording is started by pressing E-mail headset buttons only if the Sound editor window is active, otherwise pressing device buttons will not work in the Sound Editor.

**Note:** Voice recording is performed in uncompressed Wav audio format. To reduce the output file size select **Mp3 sound files** file type in the **Save as type** combo box of the Save dialog box.

**Note:** Saving Wav files in MP3 format is processed using Normal quality encoding or High quality encoding settings.

## 9.4 Filters

Sound editor also allows to apply different sound filters to the recording. You can create these filters by yourself. The Filters window can be accessed by choosing **Filters** menu item of the **Options** menu. To add a new filter use **Add** button in the Filters window. There are three types of possible filters: Tempo, Pitch or Rate. Each filter can be adjusted up or down by specifying a modifying factor value. Each filter can also be assigned a picture to make identification easier.

To edit the existing filter select it in the list on the right of Filters window and press **Edit...** button.

By clicking **Remove** button you can delete the filter currently selected in the list of filters.

Press **Test** button to listen to the result of applying the selected filter to the recording. Use **Apply** button to confirm applying of the filter. Press **Cancel** button to leave the recording without changes and close Filters window.

The same list of filters is also available from the list box in the main Sound editor window. Select one of the existing filters from the list box and press **Test** button to listen to the result of the chosen filter to the recording. Use **Apply** button to confirm applying of the filter.

## 9.5 Mpeg 3 Settings

Exact technical specifications of each setting are described below.

**Normal quality encoding:** MPEG Audio Layer-3 16kBit 11,025 kHz.

**High quality encoding:** MPEG Audio Layer-3 VBR 8-24kBit 22,050 kHz.
