Product Description

The AC power supply ([Figure 1](#)) provides power conversion directly from the facility AC input power (100 to 240 VAC nominal) to the –48V VDC used internally by the system. Power is delivered to the power supply by the AC power cord. The AC power supply is provided with an IEC 320/C20 AC inlet, rated 16A/250V (20A in North America).

Required Tools and Equipment

You need the following tools and equipment to install an AC power supply:

- Number 2 phillips screwdriver.
- Electrostatic discharge (ESD) preventive wrist or ankle strap with connection cord.
- AC power cord compatible with your power outlets. The *Cisco 10005 ESR Hardware Installation Guide* describes AC power cords available for the Cisco 10005 ESR.

Adding or Replacing an AC Power Supply

This section describes how to add or replace an AC power supply in a Cisco 10005 chassis. It contains these procedures:

- [Installing a Second AC Power Supply](#)
- [Replacing an AC Power Supply](#)
- [Troubleshooting the Installation](#)

Installing a Second AC Power Supply

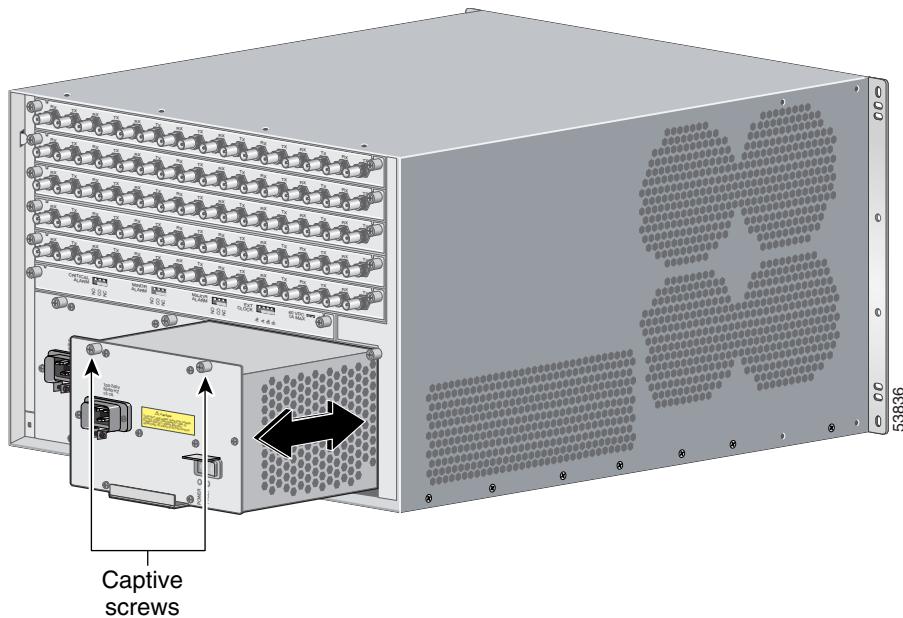

**Warning**

Never install an AC power module and a DC power module in the same chassis.

Follow these steps to install a second AC power supply for redundancy:

-
- Step 1** Put on an antistatic wrist or ankle strap. Attach the strap to the ESD grounding jack on the front of the chassis or to a bare metal surface of the chassis.
 - Step 2** At the rear of the chassis, loosen the captive screws to remove the blank cover from the empty power compartment.
 - Step 3** Before you install the new power supply, push on the left side of the power switch to set the power supply to standby mode.
 - Step 4** Insert the new AC power supply all the way into the power bay to ensure a secure connection to the midplane ([Figure 2](#)). Tighten the captive screws.

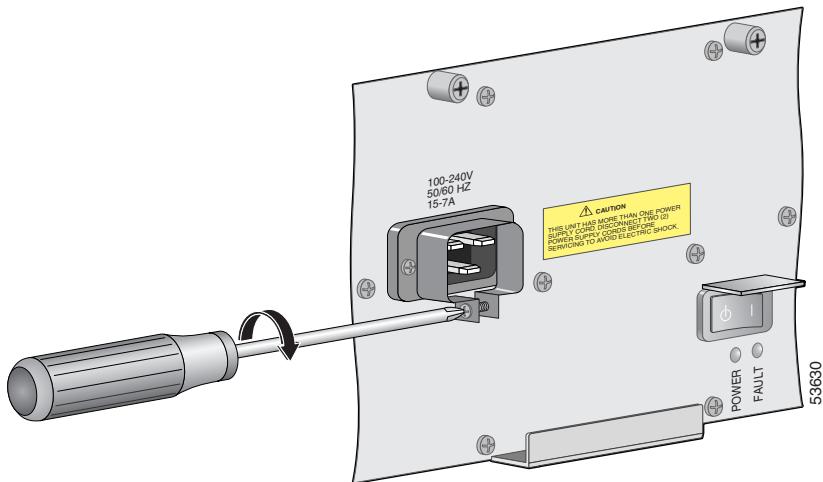

Figure 2 *Installing an AC Power Supply*

Step 5 Connect the AC power cord to the new power supply.

- Step 6** Snug up the strain relief device that secures the power cord to the power supply. To do this, tighten the screw underneath the connector (Figure 3).

Figure 3 *Tightening AC Power Cord Strain Relief*

Warning

Do not over-tighten the strain relief devices that secure the power cords to the power supplies. Because this chassis cannot be switched off completely, you must disconnect the power cords to remove power from the chassis. The power cord serves as the primary disconnect in an emergency.

- Step 7** Plug the power cord into a power receptacle.
When you connect power to the power supply while it is in standby mode, the yellow Fault LED lights.
- Step 8** Set the power switch on the new power supply to the I (On) position.
The green Power LED on the power supply lights, indicating that the power supply is supplying power to the chassis. The yellow Fault LED goes out.

Replacing an AC Power Supply

Warning

Never install an AC power module and a DC power module in the same chassis.

Follow these steps to replace an AC power supply:

Step 1 Put on an antistatic wrist or ankle strap. Attach the strap to the ESD grounding jack on the front of the chassis or to the bare metal surface of the chassis.

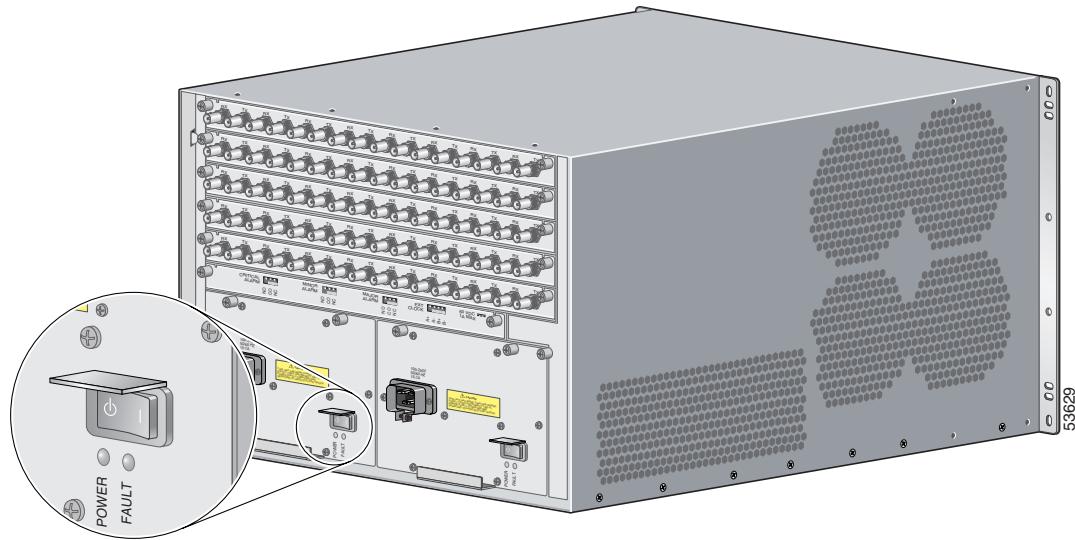

Step 2 If your system is configured with redundant power supplies, set only the power switch *of the power supply you are replacing* to the standby position ([Figure 4](#)).

Caution

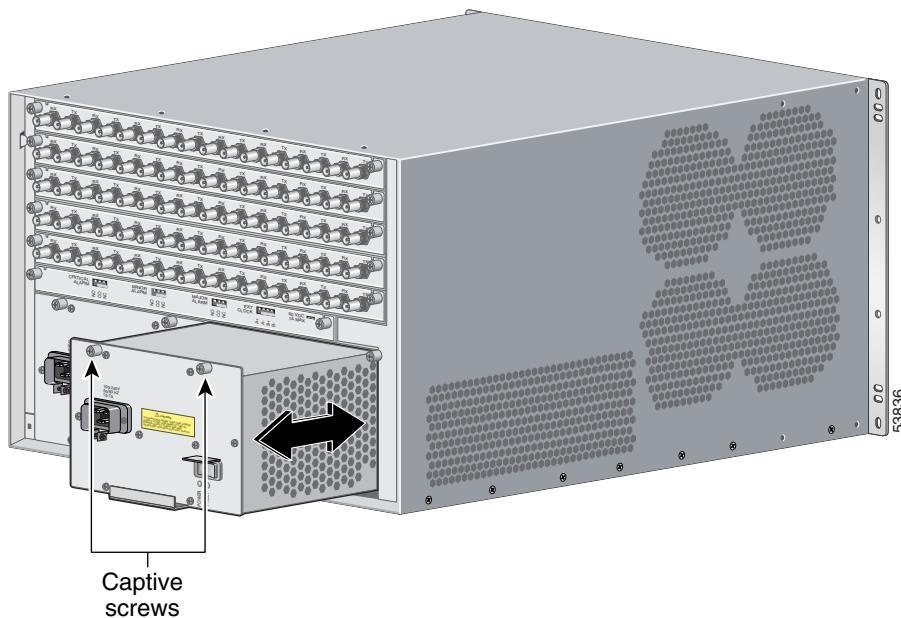

Do not power off both AC power supplies in a redundant system, or the system shuts down and all data traffic stops. Power off only the AC power supply you are replacing.

Figure 4 *Setting AC Power Switch to the Standby Position*

- Step 3** Disconnect the power cable from the power supply that you are replacing.
- Step 4** Loosen the captive screws on the power supply and pull the power supply from the chassis using the handle on the faceplate.
- Step 5** Before you install the new power supply, make sure that its power switch is set to the standby position (see [Figure 4](#)).
- Step 6** Insert the new AC power supply all the way into the power bay to ensure a secure connection to the midplane ([Figure 5](#)). Tighten the captive screws on the power supply.

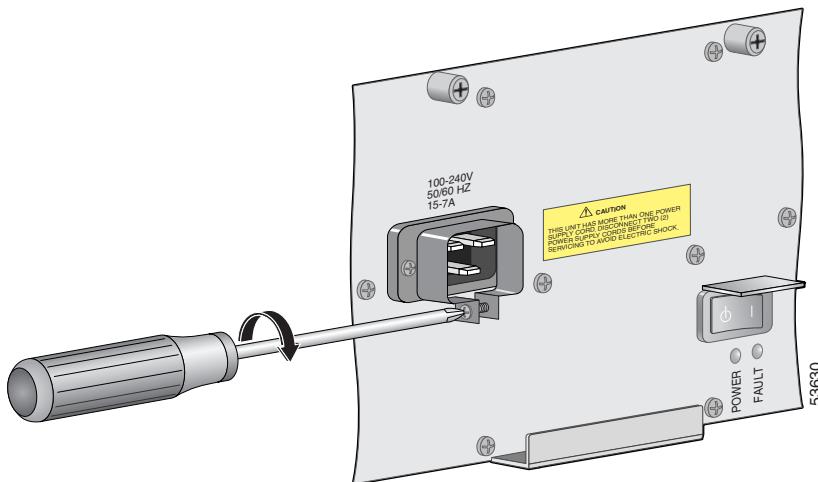

Figure 5 *Installing an AC Power Supply*

- Step 7** Connect the power cord to the new power supply.

- Step 8** Snug up the strain relief device that secures the power cord to the power supply. To do this, tighten the screw underneath the connector (Figure 6).

Figure 6 *Tightening AC Power Cord Strain Relief*

Warning

Do not over-tighten the strain relief devices that secure the power cords to the power supplies. Because this chassis cannot be switched off completely, you must disconnect the power cords to remove power from the chassis. The power cord serves as the primary disconnect in an emergency.

- Step 9** Plug the power cord into a power receptacle.
When you connect power to the power supply while it is in standby mode, the yellow Fault LED lights up.
- Step 10** Set the power switch on the new power supply to the I (On) position.
The green Power LED on the power supply lights up, indicating that the power supply is supplying power to the chassis. The yellow Fault LED goes out.

FCC Class B Compliance

The equipment described in this manual generates and might radiate radio-frequency energy. If it is not installed in accordance with Cisco installation instructions, it might cause interference with radio and television reception. This equipment has been tested and found to comply with the limits for a Class B digital device in accordance with the specifications in part 15 of the FCC rules. These specifications are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation.

Modifying the equipment without written authorization from Cisco might result in the equipment no longer complying with FCC requirements for Class A or Class B digital devices. In that event, your right to use the equipment might be limited by FCC regulations, and you might be required to correct any interference to radio or television communications at your own expense.

You can determine whether your equipment is causing interference by turning it off. If the interference stops, it was probably caused by the Cisco equipment or one of its peripheral devices. If the equipment causes interference to radio or television reception, try to correct the interference by using one or more of the following measures:

- Turn the television or radio antenna until the interference stops.
- Move the equipment to one side or the other of the television or radio.
- Move the equipment farther away from the television or radio.
- Plug the equipment into an outlet that is on a different circuit from the television or radio. (That is, make certain the equipment and the television or radio are on circuits controlled by different circuit breakers or fuses.)

Modifications to this product not authorized by Cisco Systems, Inc. could void the FCC approval and negate your authority to operate the product.
