*Heated length is four inches shorter than "B" dimension.

**All amperes based on 3-phase 60 cycle power.

† T suffix letter indicates 7 day 24 hour time clock, F suffix letter indicates flange mounting instead of adaptor box.

GENERAL

The Chromalox Unitary Electric Immersion Heater, Type RST or RSTO, is a thoroughly engineered pretested package designed to give years of service virtually maintenance free and shipped ready for installation in storage tank. They provide low watt density heating over a large heating surface with precise temperature control for such materials as asphalt, fuel oil, pitch and tar, liquid sugar, lube oils, linseed oil, and many other heat sensitive compounds.

The heating elements, either metal sheath (RST) or open coil (RSTO) are housed in 3" Schedule 40 carbon steel pipes which are

welded into the tank adaptor box. Once the Unitary Immersion Heater is welded into your tank, the heating elements are removable without draining the tank.

The control panel contains a master circuit-breaker which is safety-interlocked so the door cannot be opened when the power is on, two contactors, a two-step indicating thermostat with the temperature range of 50 to 400°F*, over-temperature cutout with manual reset, control relay, selector switches, pilot lights, and a 120V control circuit transformer.

*Optional ranges available are 50 to 300°F or -20 to 120°F.

INSTALLATION

DANGER: Hazard of Explosion or Fire. The tank must be purged of all flammable vapors prior to cutting or welding.

1. Select a location for this installation according to the following:
 - A. Heating elements are removable thru the lower half of the control enclosure but adequate room must be provided for this purpose. This removal length for the RST would be equal to the length "B" dimension as tabulated in the Specifications Table 1. The element removal length for the RSTO is 3 foot since it can be bent on a 12" radius.
 - B. The control enclosure should not be located where it will be in direct sun light or be affected by any other heating equipment in the area.
2. Cut a rectangular hole in the tank approximately $\frac{1}{4}$ " larger than the adapter box dimensions tabulated on the Specification Table 1.
3. Install heater tube supports on 10 foot centers before installing Immersion Heater assembly (refer to Figure 1). Do not anchor the heater tubes to the supports as the tubes must be allowed to expand.
- Note:** Heater tubes should be level or slightly inclined away from the control panel.
4. Insert heater tubes and position adapter box as per Figure 1.
5. Weld adapter box to tank insuring that the weld is liquid tight.
6. Tank suction pipe should be mounted at least 2" above the level of the heaters. A separate line can be provided to drain tank after heaters have been de-energized.

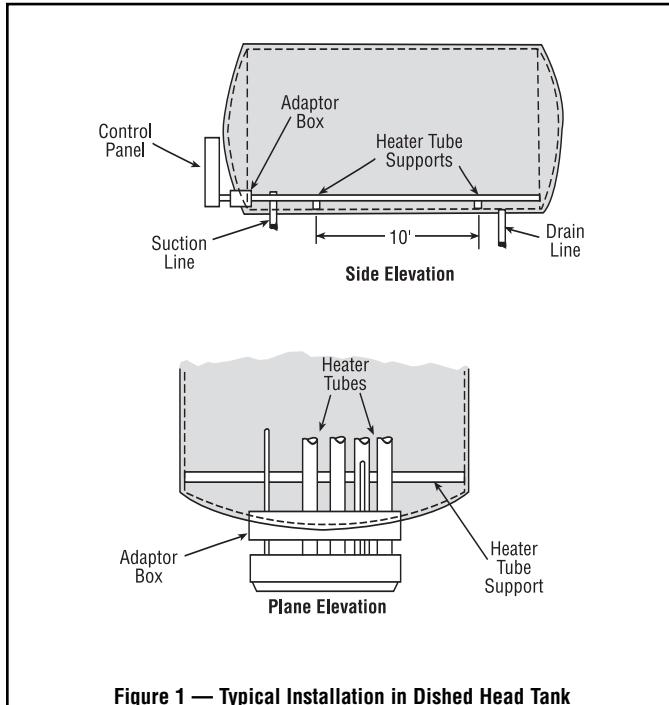

Figure 1 — Typical Installation in Dished Head Tank

WIRING

CAUTION: Hazard of Electric Shock. The Unitary Immersion Heater must be grounded using grounding means provided in the control box and employing wiring in accordance with National Electrical Code.

1. This heater assembly is completely prewired. The only wiring necessary is the terminals L1, L2, L3 on the main circuit breaker and the grounding lug in the control panel.
Note: All electrical connections should be checked and tightened if necessary. These sometimes loosen during transit.
2. The Unitary Immersion Heaters's internal wiring is per the typical wiring diagram (Figure 2) with the kW loads being tabulated in Table 2.

WIRING

Typical Wiring Diagram for Type RST and RSTO

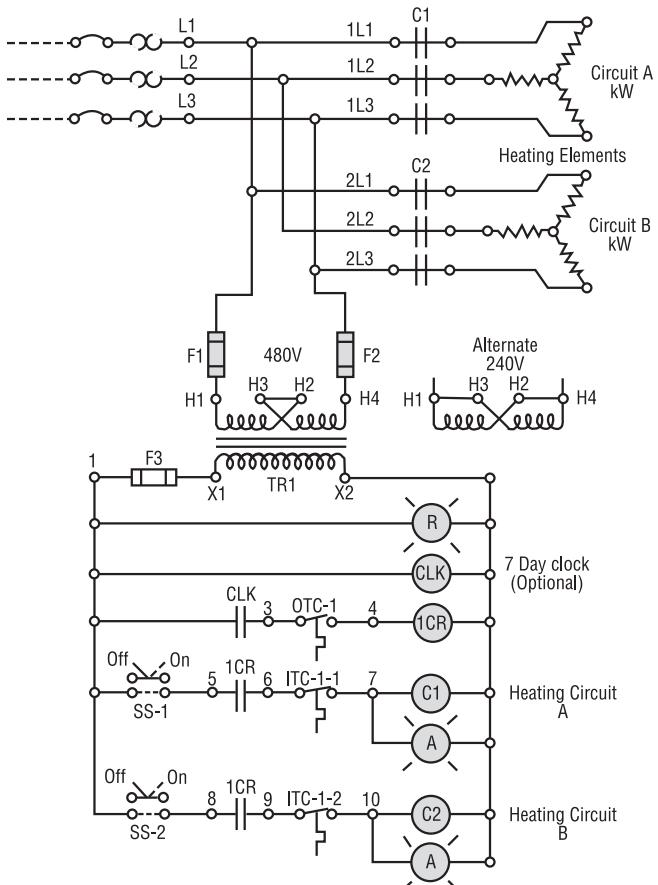

Figure 2

OPERATION

CAUTION: To avoid possible damage to the heater, do not energize until the tank is filled with fluid. Recommended fluid level is 2" above the heater tube or pipe.

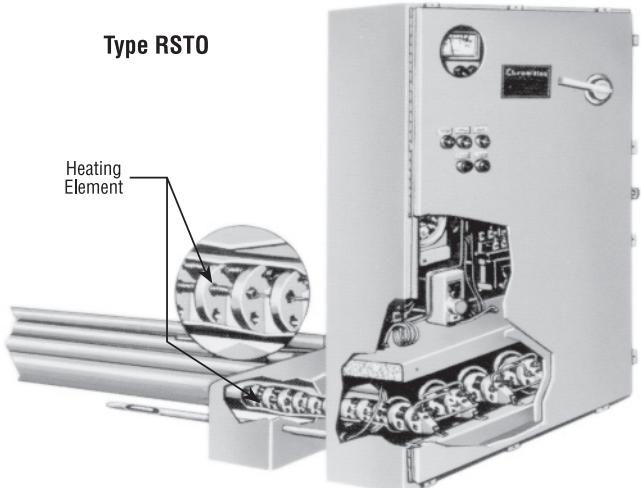

1. Turn the master circuit breaker off and open the control box door.

- Set the indicating temperature control at the desired temperature and the over-temperature cutout 50°F above this temperature.
 - Close the control box door and turn the circuit breaker on. To energize the heater circuits, turn the on-off selector switch to the “on” position.

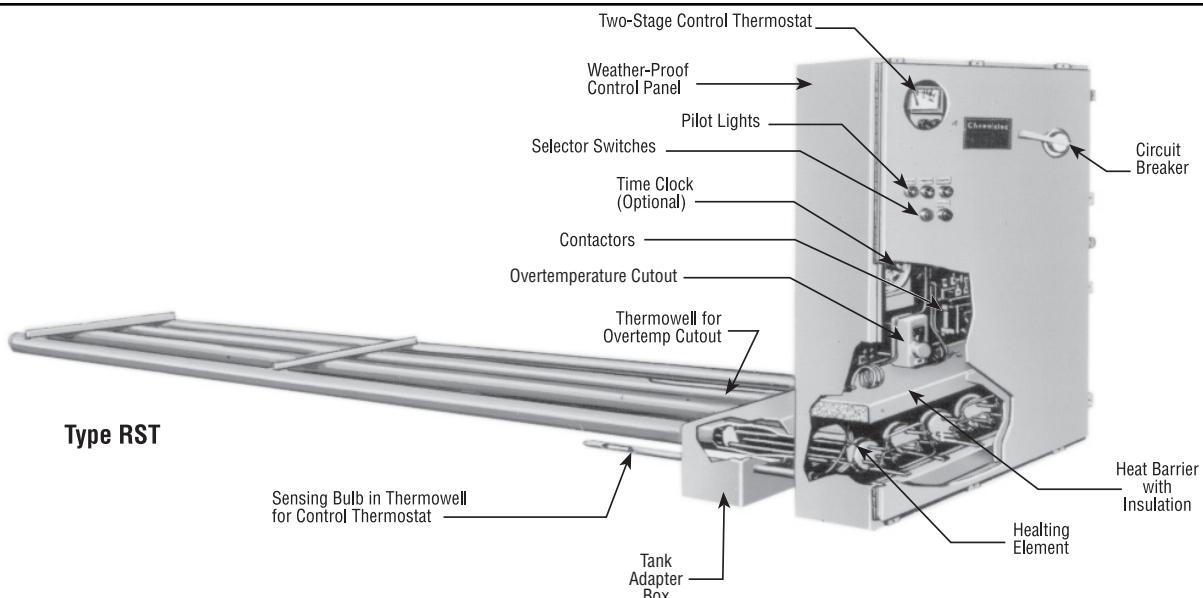

MAINTENANCE

CAUTION: Hazard of Electrical Shock. Disconnect all power before servicing or replacing the heaters.

- To remove the heating element, first turn the circuit breaker to the off position. Then open the control box door and remove the screws from the sheet metal isolating panel located in the lower half of the control box.
 - When removing the heating elements, make certain that the terminals and the ceramic insulators (RSTO type only) do not contact oil or any other liquid foreign matter.
Note: Chromalox cannot be responsible for failures or damage caused by contamination on the ceramic insulators.
 - Next remove the element wiring and finally the element mounting screw. Now pull the element straight out of the heating tube.
 - Note:** Check electrical connections at heater terminals and tighten if necessary. This will help avoid hot terminals which could destroy wiring insulation or heater terminals.

MAINTENANCE

OPTIONAL EQUIPMENT

**Adaptor Flange (Suffix F) in Place of Adaptor Box
(Typical)**

CHROMALOX TYPE TMC 7-DAY TIMER (SUFFIX T)

TMC 7-day Calendar, Electric Dial Timer is used to provide automatic start-up/off-on control of large tank heaters or could be set up for non-peak operation. Standard features: 7-day calendar dial permits different on/off schedules on different days of week. 2 to 14 replaceable trippers for up to 4 on/off operations per day, up to 28 on/off operations per week. 3 hour minimum on or off time; 21 hour maximum on or off time. Independent 4-pole design

allows SPST, DPST, SPDT switching. Manual on/off lever transfers switch operation without disturbing daily or weekly preset schedule. Heavy duty synchronous motor suitable for operation between -40°F and +140°F. Switch slider bar assures positive switching. Heavy duty terminals accommodate up to AWG No. 8 Wire.

OPTIONAL EQUIPMENT

OPERATION

"Off" Setting – de-energized the entire control circuit, thus de-energizing all heating circuits in the system.

"Automatic" Setting – allows the Day-Night Clock Panel to cycle the control system according to the program clock dial tripper settings.

To Set Trippers – refer to picture for typical setup of a Seven Day Program. Two trippers must be used for each day; an "A" tripper for switching from "Night Setback" to "Day Operation" and a "B" tripper for switching from "Day Operation" to "Night Setback".

WARNING: To set the correct day and time at beginning of initial start-up, ROTATE THE PROGRAM CLOCK DIAL CLOCKWISE ONLY. DO NOT ATTEMPT TO TURN POINTER!

Adjusting and Maintenance of Time Switch:

1. Periodically check trippers to insure that they are tightly fastened to Program Clock dial.

WARNING: Tighten trippers with fingers only!

2. Rotate Program Clock dial CLOCKWISE one hour in Spring to adjust for daylight savings time (in areas where required). In Fall, carefully rotate clock dial CLOCKWISE approximately one full turn to reset at correct day and time for standard time. Check all trippers to insure they have not moved during rotation.
3. The Program Clock motor is permanently lubricated. Lubrication of other parts is not required.
4. The Program Clock switch contacts are factory set and need no field adjustment.
