

M2 Line Balanced

Level 2 line pre-amplifier

Owner's Information

Music's Finest Conductor

Introduction to the M2 Line Balanced pre-amplifier

Congratulations on your purchase of the Audio Note M2 Line Balanced level 2 pre-amplifier.

Audio Note Level System

First, a word about how we classify our products at Audio Note. The world renowned Audio Note Ongaku, Kego and Gaku-on amplifiers incorporate six technological design features which give them unmatched sonic performance and clarity, placing them amongst the best amplifiers in the world. All Audio Note products are, where applicable, judged by this standard. These features are:

- Single ended output stage
- Zero negative feedback
- Directly heated triode output stage
- Pure Class A operation
- Materials and component technology
- Valve rectification

Qualification for level 2 requires the inclusion of at least two of these features.

The M2 Line Balanced

The M2 Line Balanced is based on the M2 Line, but this incarnation features an optional balanced output.

The M2 Line Balanced incorporates vacuum tube technology to produce the most accurate sound possible. We have developed the M2 Line Balanced using a "comparison by contrast"* technique of aural evaluation - a system that is currently unique to Audio Note.

Please read this manual carefully in order to obtain the best possible performance and longevity from your pre-amplifier.

*An essay dubbed "Audio Hell" which describes this system is available from Audio Note on request.

Unpacking and installation

Please ensure care is taken when unpacking the pre-amplifier. We recommend that you store the packing materials in case the unit requires shipping at a later date. Also, check that no transit damage has occurred before installing the pre-amplifier.

Select a suitable location for the unit, ensuring that adequate ventilation is provided as the pre-amplifier generates considerable heat during normal operation. Avoid sitting the M2 Line Balanced close to any other equipment, such as a power amplifier, that may be generating a strong magnetic field, or in close proximity to active mobile telephones.

The M2 Line Balanced is capable of driving long interconnects to power amplifiers and so, if you are using mono block amplifiers, it may be worthwhile to locate them close to the speakers. This will reduce the speaker cable lengths and provide sonic improvements.

Connections

Line input

Each line input is suitable for connecting to any line level music source. Line level sources include CD players, radio tuners, televisions etc. Each line input consists of a pair of RCA connectors. The M2 Line Balanced has 4 line inputs available.

Tape loop

The tape loop is available for connecting to a cassette deck. The 'tape in' connections should be connected to the cassette deck's 'line out' and the 'tape out' connections should be connected to the cassette deck's 'line in'. The tape in can be used as an additional line input if required. The RCA connectors are marked red for the right channel and white for the left channel.

Feedback switches

Two feedback switches are located next to the ground terminal on the rear panel. These are used for matching the pre-amplifier to the rest of your system. Set the switches to the 'on' position if any of the following apply, when in doubt, choose the setting that provides the best sonic performance:

- If the volume control is too sensitive.
- If the interconnects between the pre-amplifier and the power amplifier are longer than 3 metres.
- If your amplifier has an input impedance of less than 50 kOhms

NOTE: Always turn the power off before adjusting the feedback switches. Ensure that both feedback switches are in the same position.

Balanced output

The balanced outputs are provided to be used with power amplifiers equipped with a balanced input option. Using the balanced option can sometimes result in a better sound quality, depending on the exact design of the power amplifier.

Unbalanced output

There are 2 sets of unbalanced outputs provided for Bi-amplified systems. Both sets are identical and may be used for single amplifier operation. The connectors are marked red for the right channel and white for left channel.

NOTE: The balanced/unbalanced selection switch must be set to the appropriate position. It is not recommended to use both the balanced and unbalanced outputs simultaneously.

Mains power connection

Use the supplied cable to connect the IEC inlet socket on the pre-amplifier to the mains supply. Ensure the power is switched off when you do this.

NOTE: It is important that all connections are firm, secure and airtight. Any oxidation of the interconnects will result in loss of performance. Always use high quality interconnects - Audio

Note interconnects are recommended, as they are manufactured to the same exacting standards as all of our products.

Operation

Once all the connections are completed and checked, make sure all power amplifiers are off and flip the mains rocker switch located on the back panel of the pre-amplifier to the 'on' position.

The M2 Line Balanced is a vacuum tube design and therefore requires about 45 seconds warm-up time. After this the remaining system components may now be turned on.

In order to use the line inputs, select 'source' and the appropriate input. To listen to a tape select 'tape', the position of the source selector will not affect the output when 'tape' is selected.

The volume control adjusts the overall output level of the pre-amplifier while the balance control can be used to correct minor imbalances in the stereo image. The balance control provides 9dB of attenuation for each channel. It will not reduce the volume of either channel to zero.

Bedding-in time

The pre-amplifier requires around 200 hours of initial use (called 'bedding-in time') before the circuitry becomes stable and optimum performance is realised. As the pre-amplifier beds in, the sound will become more lucid, detailed and expansive.

After the initial bedding-in, a short warm-up period is required each time the unit is turned on before optimum sonic performance is reached.

The M2 Line Balanced is designed for continuous operation and may remain switched on, even when not in use. You may, however, prefer to turn the unit off between uses by using the power switch located on the back panel, next to the mains inlet socket.

NOTE: Always turn the pre-amplifier(s) on before turning on the power amplifier and always turn the power amplifier off before turning off the pre-amplifier. This will prevent any buzzing or popping sounds from occurring.

After-care

Cleaning

Cleaning the M2 Line Balanced is best done with a soft brush - some photographic stores are able to provide suitable brushes. Alternatively, a soft cotton cloth may be used with a mild propriety cleaner for removing dirt build-up. Strong or alcohol based solvents may damage the finish of this amplifier. Ensure the pre-amplifier is switched off and cold when cleaning. Do not wet the unit.

Replacing the vacuum tubes

The vacuum tubes in the M2 Line Balanced are carefully selected from Audio Note's vast stock to provide optimum performance and reliability. Should these tubes require replacement, please contact your Audio Note dealer, who will be able to supply the correct parts.

Warranty and servicing

Audio Note warrants that this product will be free from defects in materials and workmanship for one year from the original date of purchase from an appointed Audio Note dealer. The vacuum tubes are warranted for three months.

In the event that your Audio Note product requires servicing, please contact your Audio Note dealer. If the component needs to be shipped, please use the original packaging materials and include a copy of the sales purchase with a note, explaining, in as much detail as possible, the problems that you are experiencing with the unit.

Any modification not authorised by Audio Note will invalidate any warranty.

If you require technical support or have any questions, please direct them to your local Audio Note dealer or alternatively contact us directly at:

Technical overview

The M2 Line Balanced utilises simple but sonically effective circuitry using vacuum tube technology rather than complex techniques using impure semi-conductor type devices, so common in the audio industry.

This kind of circuit architecture is incredibly transparent and revealing. As a natural consequence, part material plays an important role in the final sonic performance, so we use only the best possible components and materials. Where components that meet our standards are not available - we make our own.

The M2 Line Balanced's circuit arrangement is briefly described below.

The line level stage is driven via high quality Noble volume and balance controls. The amplification stage uses a 6SN7 anode follower. Again, AN paper in oil and Black Gate capacitors and 1% premium resistors are used throughout. Adjustable gain and output impedance is performed by the selectable application of negative feedback around this stage.

The high voltage power supply uses a 6X5GT vacuum tube rectifier with choke input filtering and vacuum tube regulation. The vacuum tube regulator employs a dissimilar ECL82 pentode/triode, the pentode as the power device and the triode section as an error amplifier. The filament voltages are also regulated to reduce hum and noise.

Specifications

Weight (kg)	8
Dimensions	
Height (mm)	140
Width (mm)	395
Depth (mm)	450
Max Power Consumption (W)	55
Fuse Ratings	
HBC T (110/120 Vac supply) (A)	1
HBC T (220/240 Vac supply) (A)	0.5
Input Impedance	
Line input (k Ohms)	100
Phono input (k Ohms)	47
Gain @ 1kHz	
Line, feedback off (dB)	23
Line, feedback on (dB)	17
Input Sensitivity (for 1V output)	
Line, feedback off (mV)	70
Line, feedback on (mV)	150
Output Noise, unweighted (mVrms)	< 0.4
Output Impedance	
Feedback off (kOhms)	5
Feedback on (kOhms)	2.5
Tube Compliment	
6SN7	x 1
6X5	x 1
ECL82	x 1

NOTE: Due to Audio Note's ongoing research and development programme, specifications are subject to change without notice.

Safety Information

HEAT: By the nature of vacuum tubes, this product generates high levels of heat. Adequate ventilation must be provided. Do not restrict the airflow through any of the ventilation slots or place the amplifier on any surface that may restrict airflow.

CAUTION: The vacuum tubes and other nearby parts operate at extremely high temperatures - KEEP OUT OF REACH OF CHILDREN.

HUMIDITY: Do not store or operate this unit in areas of high humidity or in close proximity to water. Do not expose the unit to liquid.

EARTHING: The product must be earthed - ensure that the mains supply cable is earthed.

SHOCK: Internal operating voltages are lethal. Do not remove the top cover. Do not replace fuse without first disconnecting the unit from the mains supply.

SAFETY COMPONENTS: Internal fuses and other safety components are located inside this unit in accordance with BS 60065 requirements. In the event of component failure, replacements must be of the same part type. Such replacements must be carried out by a qualified service technician.

This product conforms to CE standards
