Introduction

Software Package: Userful MultiSeat Linux[™] (which includes Userful MultiSeat 4.0)

Version: 2011

Release Date: December, 2010

Please Note: Userful MultiSeat Linux 2011 contains Userful MultiSeat 4.0, which has been designed to take full advantage of USB multiseat devices, and differs from previous Multiplier software versions in that it **does not work with multiple video cards**. To learn more about previous versions of Userful Multiplier, please see this [User Guide](#).

Userful MultiSeat[™] 4.0 (previous versions of this software are named Userful Multiplier[™]) is software that extends Linux to support up to 11 fully independent and concurrent workstations using a single computer box. This is accomplished by adding USB multiseat devices, keyboards and mice to a single PC system and installing Userful's software.

This software is available as:

1. [Userful MultiSeat 4.0](#): A stand-alone software package compatible with Ubuntu/Edubuntu 10.04.
2. [Userful MultiSeat Linux 2011](#): Bundled with Edubuntu 10.04, iTALC and other open-source software.

Features

Userful MultiSeat Linux 2011 is a software bundle available as a DVD ISO that features:

- [Userful MultiSeat 4.0](#)
- [Edubuntu 10.04 64-bit](#) -- education flavored version of Ubuntu.
- [iTALC](#) -- teacher's classroom control tool.
- [Dansguardian](#) -- web filtering utility.
- [Java](#) -- for Java-based applications and applets.
- [Adobe Flash Player](#) -- for rich web interfaces and online videos.
- [PlayOnLinux](#) -- for installing Windows applications.
- Easy install of [Likewise Open](#) and proprietary codecs for multimedia playback.

What's New?

Changes Since Beta Release:

Linux distro support:

- Both 32-bit and 64-bit Edubuntu 10.04 are now supported.

Usability improvements:

- A new tool has been created to make the installation of extra multimedia codecs easier and smoother.

- The installation slideshow now follows the new Userful theme, and better represents the contents of the DVD.
- Better, automatic handling of video files. We've tweaked video playback settings to enhance user experience in a multiseat configuration.
- Improved handling of automatic sample student and teacher user account creation. These accounts simplify the task of getting things set up to try Useful MultiSeat Linux in a classroom setting.

Performance improvements:

- Automatic installation of Userful's special, [patched Linux kernel](#) for improved support of ten or more stations.
- 32-bit version only: Automatic installation of Userful's special, [patched GDM package](#) for a proper multiseat experience.

License Agreement

This product includes commercial software that is licensed, not sold, and is governed by an End User License Agreement (EULA). By installing, copying or using this software you acknowledge that you have read and understand this Agreement, and agree to be bound by this EULA's terms and conditions. You can review the terms of this EULA either by visiting the [online copy of the EULA](#) or by consulting the Userful - EULA.txt file included with your download

Trial Version

Userful MultiSeat will operate as a trial version until you purchase an appropriate license for your Useful system. You may purchase a multi-station license from your Useful representative or from Useful.com – see the [Licensing section](#) of the User Guide for details.

Limitations of Trial Version: The Useful MultiSeat trial software supports up to 11 concurrent stations (depending on your specific hardware) and will typically display a brief license reminder on all attached screens every 10 minutes or so.

Supported Linux Distributions

Userful MultiSeat 4.0 Supports:

- Ubuntu 10.04, 32- and 64-bit
- Edubuntu 10.04, 32- and 64-bit

Userful MultiSeat 4.0 is also offered bundled with Edubuntu 10.04, iTALC, and other software in an integrated Useful MultiSeat Linux 2011TM Install DVD image. This install DVD will allow you to partition the target computer's hard drive during the install process, and install 64-bit Edubuntu 10.04 pre-configured with Useful MultiSeat 4.0, in a single convenient installation (allowing you to easily test this on existing hardware). For details, please see [the Useful MultiSeat Linux 2011 Release Notes](#).

Internationalization

Userful MultiSeat 4.0 is fully translated into:

- English (en)
- French (fr)
- Italian (it)
- German (de)
- Spanish (es)
- Brazilian Portuguese (pt_BR) [†]
- Russian (ru)
- Turkish (tr)
- Japanese (ja) [‡]
- Traditional Chinese (zh_TW) [‡]
- Simplified Chinese (zh_CN) [‡]
- Korean (ko) [‡]

[†] The language selected must be specifically "Brazilian Portuguese"; if simply "Portuguese" is selected as a system or session language, then all Userful MultiSeat user interface strings will be in English.

[‡] These fonts may not display correctly (that is, boxes may appear instead of characters). For a workaround please see the [Userful MultiSeat known issues](#).

Recommended PC Specifications

For up to 6 stations (onboard plus 5 USB multiseat devices):

- * Dual Core Processor
- * 2GB RAM

For up to 11 stations (onboard plus 10 USB multiseat devices):

- * Quad Core Processor
- * 4GB RAM

Supported Video Cards

Userful MultiSeat 4.0 is compatible with any video card supported by the underlying Linux distribution.

Information on video cards supported by Ubuntu/Edubuntu 10.04 can be found [in the Ubuntu documentation](#).

Supported USB Multiseat Devices

Userful MultiSeat is designed to support USB multiseat devices using DisplayLink® chipsets, as well as MCTTM devices with the Trigger 1+ chipset.

Userful has tested and confirmed that the following DisplayLink® and MCTTM devices are supported.

Supported DisplayLink® Devices	
Chipset (if Known)	Supported Devices
DL-125	<ul style="list-style-type: none">• HP t100 Thin Client

Getting Useful MultiSeat Linux 2011

Userful MultiSeat Linux 2011 is available as a 64-bit DVD ISO. To obtain an install disk:

1. [Download the appropriate disk image \(ISO file\)](#) and save it to your hard drive.
2. Confirm that the file downloaded without errors by using a checksum program.
3. Burn a DVD using the ISO image that you downloaded.

If you are installing **32-bit Useful MultiSeat Linux**, a custom Userful-patched version of GDM (the Gnome Display Manager) is included. Should you ever need to re-install this package, it can be downloaded from [Userful's website](#) (the checksum is [here](#)). The Userful-patched GDM file should be saved to the Desktop, and can be installed with the package manager simply by double-clicking the package icon.

Without the custom GDM package, the log-in screen experiences frequent long delays and freezing.

Installation

Note: We recommend installing Useful MultiSeat Linux 2011 onto a host PC with **no extra connected stations** (with other stations connected, the correct mouse may not be recognized). In addition, ensure that at least one monitor is connected to the onboard video card through a VGA cable so that boot screens will be visible.

To start installation from the Useful MultiSeat Linux 2011 DVD, simply

1. Ensure that the BIOS is set to boot from the optical drive (see [How To Change Boot Device Priority](#)).
2. Insert the ISO image DVD into the optical drive.
3. Restart the computer.
4. When the first install screen appears, choose "Install Useful MultiSeat Linux".

- If you already have an operating system installed, you will be asked to choose whether to erase and overwrite the existing OS, or to repartition the hard disk to install Useful MultiSeat Linux alongside your existing OS (creating a dual-boot hard disk).
 - The remainder of the installation process proceeds as with a standard Ubuntu install (please refer to [Ubuntu documentation](#) for further information, or see below).
5. Choose the default language you wish to use for the system.
 6. Select the time zone.
 7. Choose a keyboard layout.
 8. The "Prepare disk space" dialog will appear. If a dual-boot system is desired, choose to "Install them side-by-side, choosing between them each startup."
 9. Enter personal information and choose a password. **The user name and password entered at this step will be the administrator user name and password needed to configure the system later.** Please take note of it.
 10. As the last step in installation set-up, a "Ready to install" summary screen appears. Review the installation parameters chosen, and click "Install" to proceed.
 11. The Useful MultiSeat 4.0 packages will automatically be installed during the final steps of Ubuntu installation. **Please see the next section for important guidelines for getting started with Useful MultiSeat.**

Completion of installation is guided by the Useful MultiSeat setup wizard.

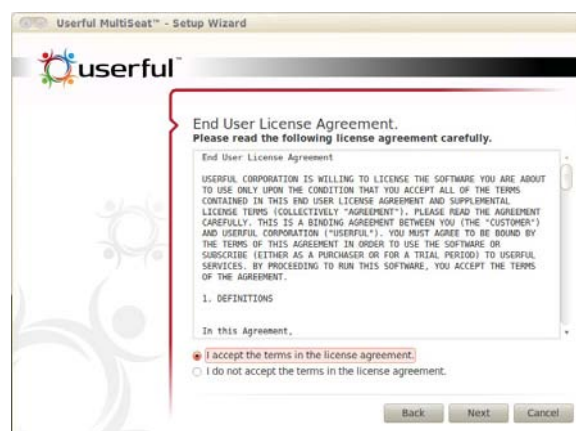

Install Wizard

Simply follow the prompts to quickly and easily install Useful MultiSeat.

End-User License Agreement (EULA)

In order to install and use Useful MultiSeat, it is necessary to accept the terms of Useful's EULA. To proceed with installation, click on the radio button beside "I accept the terms in the license agreement", then click the "Next" button.

If the Install Wizard is canceled without accepting the EULA, installation can be resumed by going to System > Administration > Useful Control Center. This will restart the Install Wizard.

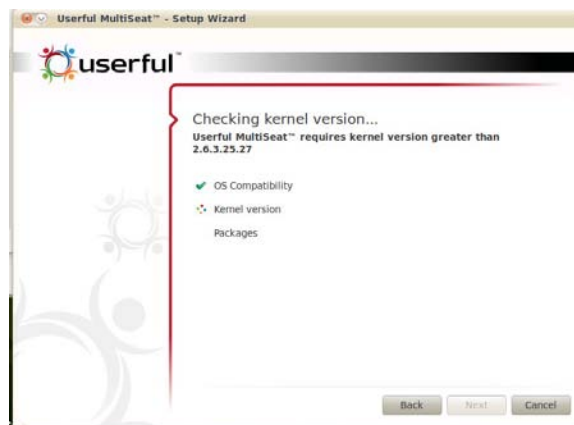

Sanity Check

Once the EULA has been accepted, the Useful MultiSeat Install Wizard performs a number of checks on the computer system to ensure that the system will support the software. The Wizard checks:

1. Operating System Compatibility
2. Package Dependencies
3. Kernel Version

If there are any issues with the computer system, a brief description of the problem will point toward a solution.

Click "Next" to proceed with installation of Useful MultiSeat. When installation is complete, a final screen will notify of that fact. Click "Finish" to close the Install Wizard.

The system must be rebooted to launch Useful MultiSeat ... but before rebooting, please refer to [the next section](#) for some important operating system set-up tasks.

Post-Install Configuration

Extra User Accounts

The Useful MultiSeat Linux 2011 installation process will automatically create a number of accounts to simplify use in a classroom setting with iTALC. Specifically, it creates:

- 12 student accounts, with usernames "student1" through "student12", and
- 1 teacher account, with username "teacher"

Each user will be prompted to enter a password the first time they log in. The exception is the administrative user (the username and password specified during installation).

If you later wish to change passwords, or need to create other accounts, please refer to [this How To](#) about the Users and Groups administration tool (located in *System > Administration > Users and Groups*).

Set a Root Password

Ubuntu/Edubuntu does not set a root password by default. Instead, Ubuntu relies on the sudo functionality (see [the sudo home page](#) for more information). However, Useful recommends setting a root password in case it is necessary to work in non-graphical mode (for troubleshooting, for example), and to access the [Useful Control Center](#) in some circumstances.

To set a root password, on the host computer:

1. Open a terminal.
2. Enter the following command:

```
sudo passwd root
```

1. Enter the sudo password.
2. Next, enter the new root password. You will be asked to repeat the password.

Update the Operating System

After installing the Userful MultiSeat Linux DVD, the operating system's Update Manager will probably launch so that the installation can be brought up to date with the latest fixes and added features. Please see below, [how to update the operating system](#) with Userful MultiSeat installed, for instructions.

The system may be restarted now, or stations may be set up before a reboot. Please see [the next section](#) for information on station set-up.

Setting Up Stations

Userful MultiSeat v.4.0 supports DisplayLink® and MCTTM USB multiseat devices. This means that extra video cards are not necessary to turn a single PC into a multistation computer. Some things to remember:

- Even when using USB-connected stations, it is important to keep one station connected to the onboard video card in order to see startup messages.
- We recommend the use of homogeneous (all one type and model) USB multiseat devices with Userful MultiSeat.

Please Note: Userful MultiSeat 4.0 has been designed to take full advantage of USB multiseat devices, and differs from previous Multiplier software versions in that it **does not work with multiple video cards**. To learn more about previous versions of Userful Multiplier, please see this [User Guide](#).

Using USB Multiseat Devices

USB multiseat devices come in various configurations. How you set up your stations depends on the kind of multiseat devices you use. Here are the most common configurations:

- USB-to-VGA adapters used in conjunction with USB hubs.
- USB docking stations with built-in USB multiseat device (some are called "thin clients"). Some have USB ports, keyboard/mouse ports, audio plug-ins, etc. All will have a VGA port.
- Monitors with a built-in USB multiseat device.

Setting Up Stations

1. Position one monitor for each station required and group each with a keyboard and mouse. Remember to keep one monitor plugged into the on-board video.
 - If you are using USB docking stations with a built-in USB multiseat device, connect one monitor, one mouse and one keyboard to each USB docking station. Connect the docking station to the host PC.
 - If using USB hubs and USB multiseat devices:
 1. Connect the multiseat devices to the USB ports on the host PC.
 2. Connect the USB hubs to the USB ports on the host PC.

3. Connect keyboard and mice to the USB hubs, one set per hub.
 - If you are using monitors with built-in USB multiseat devices, we recommend using an extra USB hub for each station. Connect one monitor, keyboard and mouse to each USB hub. (Some of these monitors can also be connected via VGA cable. Be careful not to use the VGA cable if you want to use it as a USB multiseat device.)
2. Connect an ethernet cable to the back of the host PC.
3. Ensure all devices, hubs and monitors are connected to a UPS or surge protected outlets, if necessary.
4. Turn on the system when ready.

Adding or Removing USB Stations

To add a station, simply plug in a USB multiseat device. No reboot is necessary, the station will be ready to use after a brief pause (assuming your license supports that number of stations).

Stations can be removed simply by unplugging the USB multiseat device (even from a running system).

General USB Guidelines

- USB multiseat devices only work with USB 2.0 ports.
- It is necessary to configure the host computer so that USB ports are not disabled when the host computer enters sleep mode.
- Success when using USB stations with notebook and netbook computers may vary since many notebooks have power management schemes that can interfere with or limit the amount of power allowed to USB ports.
- We do not recommend daisy chaining USB hubs or USB multiseat devices. But if you absolutely must, be sure to use powered USB hubs when daisy chaining USB stations. The USB protocol specifies a maximum of 5 hubs ("hops") per USB port. If you need to use extension cables, ensure that the distance between the USB device and the computer/powered USB hub is not greater than 5 m (15 ft) to prevent voltage drops.
- Cable quality is very important. Only use high-quality USB 2.0 compliant cables. (Note: 'compliant' is different than 'compatible'. Good quality cables often say "High-Speed Certified".) We recommend cable specifications of at least 24 [AWG](#) (power) and 28 AWG (signal). Low quality USB cables can cause excessive voltage drops that can create system instability issues or can cause a USB multiseat device to be disabled by the Linux Kernel.
- We recommend using powered hubs or Userful USB hubs with audio to connect each station.

For a more in-depth look at USB connectivity, please see [USB: Troubleshooting and Guidelines](#).

Device Assignment

Device Assignment

Userful MultiSeat 4.0 supports auto-assignment of input, storage and audio devices, when possible. In other words, any device plugged into the same USB multiseat device as a given display will automatically

be assigned to the display's station. Auto-assignment must be [activated](#) in order to work.

If the appropriate station assignment cannot be resolved automatically, Userful's "Press F-key" utility is launched. This utility allows the user to link keyboards and mice to a specific monitor with a single key press and/or mouse click.

Assigning Keyboards and Mice: The Press-F key Utility

For each workstation that requires input device assignment, the display will prompt you to press a function key (F-1 through F-10) on the keyboard in front of the monitor in order to link the correct keyboard to the specific monitor.

Both a keyboard and a mouse are required in order to create a station. If you have the mouse plugged into a the same USB hub (through a PS/2 or USB connection) as the keyboard (or, rarely, to a USB port integrated in the keyboard itself), the mouse will be automatically assigned along with the keyboard when you press the correct function key.

If the mouse is plugged into a separate USB port or PS/2 connection, you will be prompted to press a button on the mouse in order to link it with the correct monitor and keyboard combination.

Resetting Assignment

You may reassign keyboards and mice at any point by simply pressing the **Ctrl-Alt-Break** key combination or re-connecting the device by unplugging for at least 1.5 seconds and re-connecting it to the USB port while the system is running. The assignment screen will automatically appear on top of your current desktop. No work will be lost, simply press the correct F-key and return to your desktop.

Activating Device Auto-assignment

At this point in the development of Userful MultiSeat 4.0, Auto-assignment is not enabled by default. To enable auto-assignment, it is necessary to edit the `globals.py`.

1. Open the `/var/db/userful/globals.py` file in a text editor.
2. Find the `AUTO ASSIGNMENT` parameter and change the value to `TRUE`.
3. Save the edited file.

The Control Center

Userful MultiSeat 4.0 is the first release to feature the **Userful Control CenterTM**.

The Control Center features:

- A system/station status dashboard
- Individual or system-wide display configuration
- Individual or system-wide control over station access
- Software updates, license management and access to help and support

Accessing the Control Center

The Userful Control Center is a web browser-based application, so it is necessary to have a web browser installed. (A live network connection is not needed to open the Control Center, but some functions that

require access to the internet will not work without a connection.) The Useful Control Center has been designed to work with most popular browsers, but for the best experience Useful recommends using Firefox.

The Useful Control Center is located under System > Administration > Useful Control Center. A dialog window will appear asking for a password; only users with system administrator or root privileges can access the Control Center.

Some functions, such as licensing and updates, require access to the internet.

Opening the Control Center Without Network Access

If there is no network connection, the Useful Control Center will not open unless the browser is set to "Offline Mode". There is no workaround for the Chrome browser. For Firefox, the workaround is:

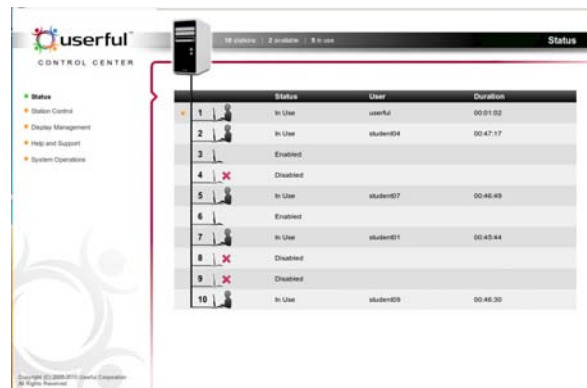

1. Use Firefox as the default web browser.
2. If the computer is only occasionally without a network connection:
 - Attempting to open the Control Center will cause Firefox to display a page asking the user to switch to "Offline Mode". Follow the instructions on the page and the Control Center will work as usual.
3. If the computer is regularly without a network connection, or if a more permanent fix is required:
 - Enter `about:config` in the address bar of Firefox. Scroll down the page to find "toolkit.networkmanager.disable". Double-click the entry to change the value to "TRUE".

Status

The Useful Control Center opens on the **Status or Dashboard** page. This page gives a snapshot of the current system status, and access to all of the functions of the Control Center.

Two features of the Status page appear **on every page** in the Useful Control Center. These are:

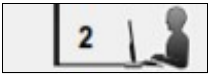

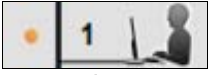

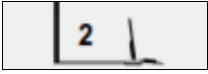

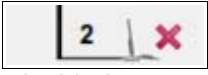

1. **The Navigation Panel** is at the left of the page. The major sections of the control panel are listed here: Status; [Station Control](#); [System Operations](#); [Display Management](#); and [Help and Support](#). (Each of these will be discussed in detail below). Holding the mouse cursor over one of the section titles causes a list of features or functions to appear. Simply click on the desired feature or function to open that section of the Control Panel.
2. **The Status Panel** is at the top of each page. A gray box next to the CPU graphic lists basic system information: the number of stations; how many stations are available (enabled, but not in use); and how many stations are in use.

	Status	User	Duration
1	In Use	userful	00:01:02
2	In Use	student04	00:47:17
3	Enabled		
4	Disabled		
5	In Use	student07	00:46:49
6	Enabled		
7	In Use	student01	00:45:44
8	Disabled		
9	Disabled		
10	In Use	student09	00:46:30

Below the Status Panel, and to the right of the Navigation Panel on every page of the Userful Control Center is the **Page Content**. On the Status page, the page content includes:

- An information bar for every licensed station on the system, indicated by the **Station number** on the left.
- Icons and text showing the state of every station, as described below.

 <p>Enabled, In Use</p>	<ul style="list-style-type: none"> • If the station is enabled and in use (that is, a user is logged in), the station icon is black and includes a user icon <ul style="list-style-type: none"> • The "Status" column of the dashboard panel will display "In Use" • the "User" column will display the user name of the person logged on to the station • the "Time" column will display the time elapsed since the user logged on. (Note: the Time elapsed does not update 'live'; rather it is updated when the status page loads.
 <p>Accessing Control Center</p>	<ul style="list-style-type: none"> • Information about <i>the station being used to access the control panel</i> is displayed with an icon with an orange dot to the icon's left. • Note: The station being used to access the control panel cannot be disabled.
 <p>Enabled, not In Use</p>	<ul style="list-style-type: none"> • If the station is enabled, but not in use, the station icon is black. <ul style="list-style-type: none"> • The "Enabled" state is also indicated in the "Status" column of the dashboard panel, while the "User" and "Time" columns are blank.
 <p>Disabled</p>	<ul style="list-style-type: none"> • If the station icon is greyed out, it indicates the station is disabled. This is also indicated in the "Status" column of the Dashboard panel. <ul style="list-style-type: none"> • The monitor at the disabled station will display a screen indicating that the station is disabled. The keyboard and mouse at the disabled station are also disabled.

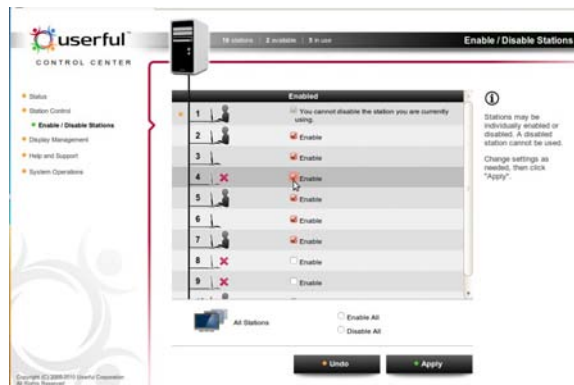

Station Control

Functions that affect **individual stations**, but do not relate to video display settings, are under this section.

Enable/Disable Stations

With the Userful MultiSeat Control Center, it is possible to disable (deactivate) or enable (activate) individual stations temporarily. A disabled station cannot be used; the monitor at the disabled station will display a graphic indicating that it is disabled, and the keyboard and mouse do not work. It is also possible to enable or disable all the stations (except for the station being used to access the Control Center) of a system quickly and easily.

To open the "Enable/Disable Stations" page, go to the Navigation Panel (at the left side of the screen) and select **Station Control > Enable/Disable Stations**.

The "Enable/Disable Stations" page (see illustration at right) has the same general format as the Status page. Note that the Navigation and Status panels are unchanged, but the Page Content now includes checkboxes to Enable every station individually (except the station being used to access the Control Center, which is shown with a green background).

Below the list of individual stations are radio buttons to "Enable All" or "Disable All" stations; again, the station being used to access the Control Center will not be affected. Once a change is made, "Apply" and "Undo" buttons at the bottom of the screen activate. **Note: changes will not take effect until the "Apply" button is clicked.** There is also an information box at the right hand side of the page with in-line help.

To Enable/Disable individual stations:

1. Click in the checkbox next to the station to be enabled or disabled.
 - A checkmark in the box means that station is enabled.
 - No checkmark means that the station is disabled.
2. Click on "Apply" to complete the action, or "Undo" to reset the page.

To Enable/Disable all stations (except the one used to access the Control Center):

1. Click in the radio button next to "Enable All" or "Disable All"
2. Click on "Apply" to complete the action, or "Undo" to reset the page.

Display Management

The Display Management section of the Userful Control Center is the place to change [monitor settings](#) such as resolution and color depth, to and [optimize performance by adjusting graphics settings](#).

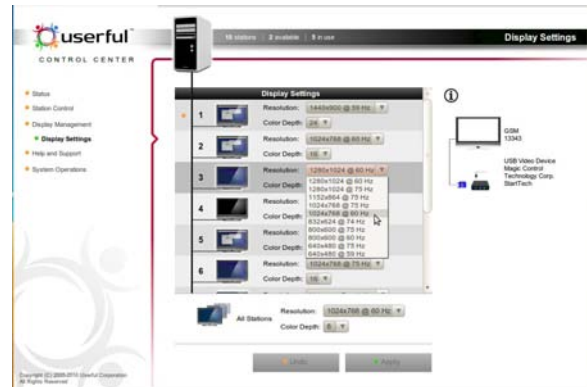

In addition, 'mousing over' a given station will display information about the attached hardware (see illustration below, where hardware information for station 3 is being displayed on the right side of the screen).

Display Settings

With the Userful MultiSeat Control Center, it is possible to change monitor resolution on individual stations or system wide. Color depth can be changed system-wide. Userful MultiSeat detects appropriate resolutions for each connected monitor, and offers those choices in an easy-to-use drop-down menu.

To open the "Display Settings" page, go to the Navigation Panel (at the left side of the screen) and select Display Management > Display Settings.

The "Display Settings" page (see illustration at right) has the same general format as the Status page. Note that the Navigation and Status panels are unchanged, but the Page Content now includes drop down menus to change monitor resolution on individual stations (including the station being used to access the Control Center, which is shown with a green background).

Below the list of individual stations are drop-down menus to select a screen resolution or color depth for all stations. Once a change is made, "Apply" and "Undo" buttons at the bottom of the screen activate. **Note: changes will not take effect until the "Apply" button is clicked.** There is also an information box at the right hand side of the page with in-line help.

To Select a Screen Resolution for Individual Stations:

1. Use the drop-down menu to choose from a selection of appropriate resolutions for the desired station.
2. Click on "Apply" to complete the action, or "Undo" to reset the page.

To Select a Screen Resolution or Color Depth for All Stations:

1. Use the drop-down menu to choose from a selection of appropriate resolutions for all stations, or to choose a color depth for the system.
2. Click on "Apply" to complete the action, or "Undo" to reset the page.

Help and Support

Userful offers an extensive and ever-growing collection of documentation that can answer most questions and resolve most issues that may be encountered with Userful MultiSeat. If Userful's [documentation](#) cannot resolve your questions, consider [reporting a problem to Userful Customer Support](#).

Documentation

To easily access Userful's Support Wiki and all the documentation on Userful MultiSeat and Userful MultiSeat Linux, go to Help and Support > Documentation in the Control Panel.

Troubleshoot a Problem

Selecting Help and Support > Troubleshoot a Problem from the Control Center navigation tree opens a page with links to relevant documentation that will be most helpful in solving a problem, including:

- [Troubleshooting](#)
- [Known Issues](#) for both Userful MultiSeat and Userful MultiSeat Linux
- [Release Notes](#) for both Userful MultiSeat and Userful MultiSeat Linux

Report a Problem

If a problem cannot be solved using Userful's documentation, the fastest and best way to receive technical assistance from Userful's support team is to submit a problem report directly to Userful Customer Support through the Userful Control Center.

To report a problem, click the "Report a Problem" link near the bottom of the "Troubleshoot a Problem" page. A new page will open with a simple form to be filled out. When completed and submitted, the information provided will be e-mailed -- along with a selection of debugging information pulled from the computer system logs and files -- to Userful Customer Support.

Have you checked our [Troubleshooting](#) page for answers? Please check before reporting a problem.

Contact name:

Contact e-mail:

What were you doing when the problem occurred:

The problem seems to be related to:

Description of the problem:

If you are having a problem with Userful MultiSeatTM that cannot be solved using our documentation, tell us about it!

Please complete the form below to send an e-mail to Customer Support.

1. Be sure to include a contact name and e-mail so Userful Customer Support can respond to your problem report.
2. Briefly describe what action you were performing when the problem occurred.
3. From the pull-down menu, select a category that the problem seems to fall under. Use the "Other" option if there is no clear choice.
4. Give as complete a description of the problem as possible. To get help quickly, it is important to be as specific as possible when describing your problem.
5. When finished, click on the "Submit" button.

System Operations

Functions that affect **the entire system (that is, the host CPU and all the connected stations)** are found in the System Operations section of the Userful Control Center. These include:

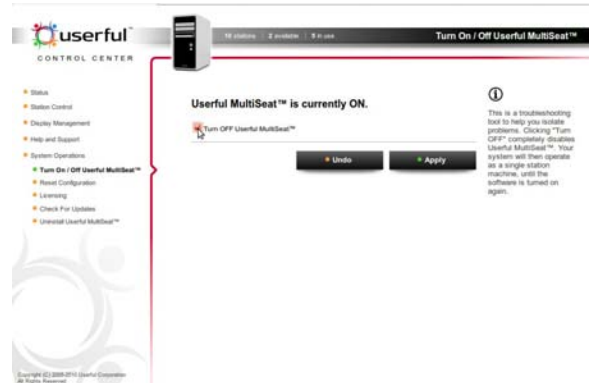

- [turning off the Userful MultiSeat software](#)
- [managing licenses](#)
- [checking for updates to Userful MultiSeat](#) and
- [reinstalling or uninstalling MultiSeat](#)

Turn Useful MultiSeat On and Off

To access this function, go to System Operations > Turn On/Off Useful MultiSeat.

Because this feature affects the entire system, individual stations are not listed on this page. Instead, a status message indicates whether Useful MultiSeat is operational ("Useful MultiSeat is currently ON") or disabled ("Useful MultiSeat is currently OFF").

When Useful MultiSeat is first installed, the Setup Wizard enables MultiSeat by default. If the "Turn on Useful MultiSeat" box is unchecked before the post-installation reboot, it will be necessary to turn on MultiSeat from the Control Center.

To turn on Useful MultiSeat:

1. Click on the button marked "Turn ON Useful MultiSeat".
2. A pop up window appears, indicating that a reboot is necessary to complete the action. Click "OK" to proceed. **Useful MultiSeat will not begin to work until the system is rebooted.**
3. When the system is rebooted, it will be running in MultiSeat mode.

As a troubleshooting step, it may be necessary at some point to turn off Useful MultiSeat and return the system to a single-user configuration. When MultiSeat is turned off, all services are stopped and disabled, and all stations except the onboard video station are lost -- even if the Control Panel is being accessed from one of those stations.

If an application or feature is not working, turning off MultiSeat can help determine:

- *Whether the problem lies with the operating system or another application.*
 - If the problem occurs when MultiSeat is turned off, then MultiSeat is probably not causing the issue
- *Whether the problem results from multiplying the system.*
 - If everything works in single-user mode, and the problem occurs only when MultiSeat is turned on, it could indicate an issue with Useful MultiSeat -- see below for more information about [Help and Support](#).

To turn off Useful MultiSeat:

1. Click on the button marked "Turn OFF Useful MultiSeat".
2. A pop up window appears, asking for confirmation of the action. Click "OK" to proceed. **Useful MultiSeat will shut down immediately, and all stations except the onboard station will be shut down.** No reboot is necessary.

Reset Configuration

To access this function, go to System Operations > Reset Configuration.

Because this feature affects the entire system, individual stations are not listed on this page. Instead, a checkbox allows the administrator to reset any changes that have been made to configuration files.

To Reset Configuration:

1. Click the checkbox marked "Reset Configuration" and click the "Apply" button.
2. Click "OK" in the dialog box asking if you wish to continue (or "Cancel" if you wish to cancel the action).
3. Reboot the system.

Licensing

To enable the full version of Userful MultiSeat, you need to purchase a valid license for each multi-station computer system. The unlicensed version of Userful MultiSeat is fully functional, supporting up to 11 concurrent stations (depending on your specific hardware), but will display a brief registration reminder on all attached screens every 20 minutes or so.

To get a license key, after installing Multiplier software, simply:

1. Purchase an activation code from Userful (or a Userful Partner) for up to 11 stations, or
2. Register for the Free 2-User license (for two stations only),
3. In some cases, Userful may send a license key file electronically.

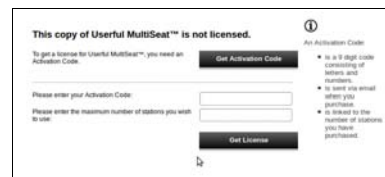

Activating and/or installing license keys is done through the Userful Control Center.

To open the Licensing section of the Control Center, go to the Navigation Panel and select System Operations > Licensing. A screenshot of the Licensing page for an unlicensed system is at right. From this page one can [get an activation code and license key through the internet](#) or [install a license key file](#).

If the system is already licensed, System Operations > Licensing will open the [License Details page](#).

Getting License Key Online

To get a license key online, click on the button that says "Get a license key through the internet". A page where an activation code can be entered will open (see illustration to the right).

- **If Useful has already provided an activation code**, simply enter it in the first box. In the second box, enter the maximum number of stations to be used.
 - **Note:** the activation code is tied to a certain number of stations. The number of stations entered on this page CANNOT exceed the number specified when purchasing or obtaining an activation code. For example, if a Free 2-User activation code is being used, the number of stations cannot be greater than 2.
- **To obtain an activation code for a Free 2-User license**, simply click on the button labeled "Get Activation Code". This opens a new browser window for the Useful Licensing Server (see the illustration at right). Follow the directions to register for and/or retrieve the activation code for a Free 2-User license.
 - Once an activation code has been obtained, return to the Useful Control Center to enter the code and install a license key.

As part of the activation process, your web browser submits basic system information to Useful -- including your system's MAC address, Linux distribution and version, and video card. The license key file(s) are installed automatically, and take effect without rebooting the system.

Installing a License Key from a File

To install a license key from a file that Useful or a Useful partner has provided:

1. Copy the file to the desktop of the system to be licensed, or mount a USB flash drive containing the license key file.
2. From the [starting screen of the Licensing section](#), click on the button marked "Install a license key from a file". The page seen to the right will open.
3. Click on the "Browse" button and navigate through the file system to the directory where the license key is saved. Select the license key file and choose "Open".
4. Click on the "Install License" button. The license key file is installed automatically, and takes effect without rebooting the system.

Viewing License Details

On a licensed system, selecting **System Operations** > **Licensing** will open the License Details page, which lists important information about the system license:

1. Product Name
2. Reseller
3. Maximum Number of Stations
4. System ID
5. Issue Date (when license was issued)
6. Expiry Date (when license will expire)
7. Support Expiry Date (when a support contract, if applicable, will expire)
8. Trial Message Interval (time, in minutes, between appearances of the Registration Reminder screen on unlicensed systems)
9. Trial Message Duration (time, in seconds, that the Registration Reminder screen on unlicensed systems stays on the screen)

Update Software

The Userful team is continually working to improve our products performance and feature set for upcoming version releases. Occasionally, Userful may release important updates between official software version releases.

To check for such updates, select **System Operations** > **Check for Updates** from the Navigation Panel.

- By default, the system checks for updates automatically; if any are available, they will be listed on this page.
 - Remove the checkmark from the "Automatically Check for Updates" checkbox to check for updates manually.

To install available updates:

1. Select the one(s) to be installed and click on "Install Updates".
2. Click "Apply" to confirm your selection and begin download and installation of the chosen updates. (Click "Undo" to reset the page).

Reinstall or Uninstall Useful MultiSeat

If it ever becomes necessary to uninstall Useful MultiSeat, it can be easily done through the Control Center.

To uninstall Useful MultiSeat, go to **System Operations** > **Uninstall Useful MultiSeatTM** and click the button called "Uninstall Useful MultiSeatTM".

Licensing

With Useful MultiSeat 4.0, licensing is quickly and easily managed through the [Userful Control Center](#). The following types of licenses are available:

Free 2-User License

Userful offers a Free 2-User License for Useful MultiSeat and Useful MultiSeat Linux. The Free 2-User license can be easily obtained through the [Userful Control Center](#).

Commercial License

To obtain a commercial license for up to 11 stations per PC, please contact Userful as described below.

To purchase an activation code online (for orders within the U.S. and Canada):

1. Shop for all your Useful MultiSeat needs at the [Userful Store](#).
2. Choose the number of MultiSeat bundles (one per planned workstation) and complete checkout. You will need to register as a customer to make a purchase.
3. Once your order is processed, you will be sent an e-mail with your activation code, where to download Useful MultiSeat software and Web links to Useful Support documentation.

To purchase an activation code from a Useful Partner (for orders outside North America):

1. For international orders, please e-mail partner@userful.com or fill out this [form](#).
2. Once your order is processed, you will be sent an e-mail with your activation code, where to download Useful MultiSeat software and Web links to Useful Support documentation.

Updates to the Linux Operating System

IMPORTANT: If you are using the Useful-patched kernel, **do not** get system updates using the graphical Update Manager. It is important not to over-write the custom kernel. Please see [Appendix C](#) for more information.

Operating systems such as Ubuntu/Edubuntu are works in progress, and updates are released frequently. Most Linux operating systems will notify users automatically if updates are available; alternatively the OS should have an "update manager".

- In Ubuntu/Edubuntu, got to System > Administration > Update Manager

For smooth functioning of Useful MultiSeat, **it is very important to TURN OFF Useful MultiSeat before updating OS software.**

Userful MultiSeat can be turned off and on in the Control Center. Please refer to the [System Operations documentation](#) for more information.

After OS updates are complete, return to the Control Center to turn Useful MultiSeat back on. Reboot to complete updates and re-initialize Useful MultiSeat.

If Useful MultiSeat is not turned off before updates are installed, some packages may not update properly. When a conflict is encountered, a popup will come up warning that Useful MultiSeat must be turned off and the update process will stop. To set things right again, do the following:

1. Turn off Useful MultiSeat, using the Control Center or by entering the following at the command line:

```
$ sudo useful system --off
```

2. Correct any issues caused by the interrupted update by entering the following:

```
$ sudo dpkg --configure -a
```

3. Check for and install updates using the operating system Update Manager.
4. Turn on Useful MultiSeat, using the Control center or by entering the following at the command line:

```
$ sudo useful system on
```

Userful MultiSeat Linux: Extra Features

Because Useful MultiSeat Linux 2011 is a bundle of software, Useful has been able to include some special features and additional software to enhance user experience.

Special Folders Make File Sharing Easy

Userful MultiSeat Linux installs two special folders on the root of the filesystem:

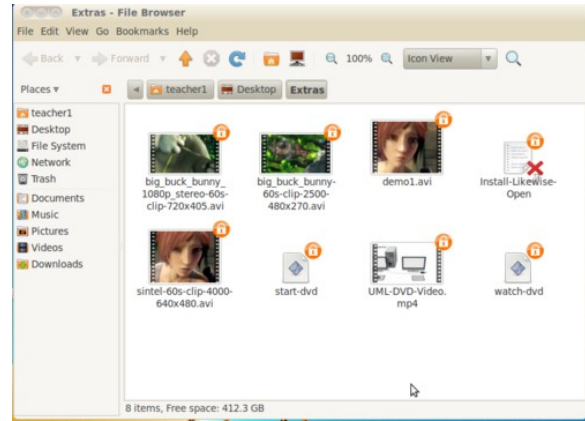

```
/teacher  
/student
```

A shortcut to each of these folders is also installed on each user's desktop. The shortcut to the /teacher folder is labeled "Extras". The shortcut to the /student folder is labeled "Shared".

The "Extras" Folder

This folder is intended for files that students should have access to but should not be able to edit or delete.

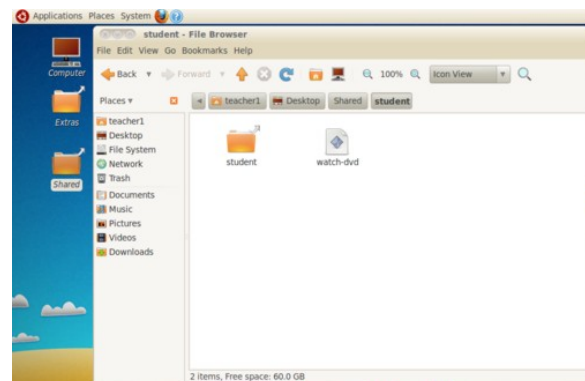

- The "Extras" folder is a shortcut to the /teacher directory in the root filesystem.
- Only the "teacher1" user has the permissions to edit, save to or delete from this folder.
- All users, including students, can view and execute files in this folder.
- Teachers can save files or media in this folder for the students to view.

The "Shared" Folder

This folder is accessible to all users.

- The "Shared" folder is a shortcut to the /student directory in the root filesystem.
- All users have permissions to edit, save, execute or delete from this folder.
- Students can share files freely with other students and the teacher via this folder.

MultiMedia

Video Playback from a File

Userful MultiSeat Linux 2011 installs a few sample video files. Shortcuts to these files can be found on every user's desktop in the "Extras" folder. To play these sample videos, simply double-click on the file icons.

Installing Proprietary Codecs for DVD, MP3 and More

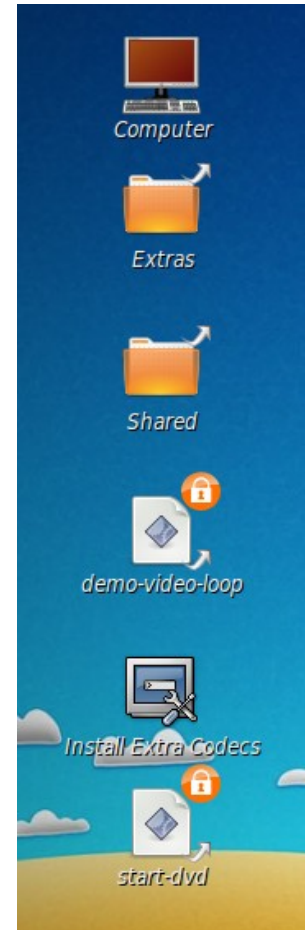

Codecs used to play DVD video, MP3 music, and certain other file formats, must be installed separately. To do this:

1. Log in as "teacher1".
2. Go into the Extras folder on your desktop.
3. Double-click on the Install - Extra - Codecs icon (see illustration at right, second from the bottom).
4. When prompted, do *not* use the Run option. You should use the Run in Terminal option so that you are able to observe the progress of the installation.
5. Follow the on-screen prompts to complete the installation. The installation may take several minutes.
6. When installation has finished, a webpage with further information about proprietary codecs will open. Please read this page if you want more information about these licensed codecs.
7. Reboot the machine when finished.

Video Playback from a DVD

With Useful MultiSeat Linux 2011, it is possible to play a DVD in the host computer's optical drive and have all stations view it simultaneously. To do this:

1. Insert DVD.
2. The "teacher1" account runs the start-dvd program by double-clicking on the file, which is located in the Extras folder. Click on the Run button when prompted.
3. Each student who wishes to view the video must run the watch-dvd program by double-clicking on the file, which is located on their desktop. Click on the Run button when prompted.
4. Any user can press Esc to stop playback.

Using Third-Party Software Included with Useful MultiSeat Linux

Userful MultiSeat Linux 2011 is a software bundle that includes a Linux OS as well as a number of other open-source programs chosen for their utility in a classroom setting. This section includes more details about these programs.

For a complete list of software installed when Useful MultiSeat Linux is installed, please see ["Userful MultiSeat Linux 2011: Applications"](#).

Java and Flash

Userful MultiSeat Linux 2011 comes with [Java](#) and [Adobe Flash Player](#) already installed, to improve online experience.

iTALC

[iTALC](#) is open-source software developed as a teacher's classroom control tool. iTALC is installed during the Useful MultiSeat Linux installation; in addition Useful's iTALC integration package is installed. For quick start-up, [1 teacher and 12 student accounts are set up automatically](#).

For more information, please see [Using iTALC Classroom Control Tool](#).

Dansguardian

Teachers can manage which websites students can access in a Userful Multiseat Linux lab using the free, open-source program [Dansguardian](#). With Dansguardian installed (on the Ubuntu/Edubuntu 10.04 system), teachers and administrators can create **whitelists** (allowed sites) & **blacklists** (banned sites). For more information please refer to [How to Filter Web Content with Dansguardian](#).

PlayOnLinux

Use Windows applications on your Userful MultiSeat system with [PlayOnLinux](#), which is installed automatically with Userful MultiSeat Linux.

Install Likewise Open

[Likewise Open](#) integrates Linux systems with Active Directory. Userful Multiseat Linux 2011 comes with a script to easily install Likewise Open. To install:

1. Log in as a Teacher
2. Go to the "Extras" folder on the Desktop
3. Double-click on the "Likewise Open" .deb package.

Tips & Tricks for Userful MultiSeat

Understanding USB

In simple terms, **USB (Universal Serial Bus)** describes a way to connect a hardware device (or peripheral) to a controlling device (usually a computer). The term USB also includes the way that the device(s) and controller communicate. USB connectivity is the standard for a wide range of devices and peripherals.

For a checklist for troubleshooting problems with USB devices, hubs or connections, and an overview of best-practices when using USB connections between a PC and peripheral devices (such as keyboards, mice, flash drives, cameras, etc.) and between a PC and multiseat devices (devices that have built-in video card and USB hub capability), please refer to Userful's [USB Guidelines](#)

DL-Driver Performance

The performance of the Userful DL-DriverTM for Linux depends on CPU processing power; performance will degrade as more devices are added.

MCT Driver Performance

As with the DL-Driver, performance of the MCTTM driver in a multiplied system appears to depend on processing power. More powerful host computers will yield higher performance, especially with processor-intensive tasks like full-screen video.

The MCT driver handles video differently from the DL-driver, and so the appearance of movies, video or

flash animations may be less smooth than with the DL-Driver.

Maximizing USB Display Performance

When using 5 or more USB multiseat devices, it is best (where possible) to divide these devices over two USB buses. Many mid-range or better motherboards have two built-in internal USB 2.0 buses. (You can also add an additional USB 2.0 bus by purchasing and installing an appropriate PCI expansion card.

You can see how many "2.0 root hubs" you have and which USB devices are attached on which buses by opening a terminal window and typing at the command prompt:

```
$ lsusb
```

USB-connected Station Hotplugging

With Useful MultiSeat 4.0, USB-connected stations are **hotpluggable**, meaning that USB connections can be plugged and unplugged on a running system without requiring a system reboot.

- Note: In rare cases, repeated hot-plugging of the USB Station may cause problems. If the USB station does not re-initialize correctly, simply reboot the system.

Hotplugging Input Devices

If a USB keyboard or mouse (Note: PS/2 input devices are not hotpluggable) must be unplugged from the USB multiseat device for more than 1.5 seconds to reset device assignment. The [Press-F key utility](#) will start for device reassignment.

Hotplugging Stations

If a USB multiseat device is disconnected from the computer and reconnected within 10 seconds, the session on that station will be resumed. **If the disconnection is more than 10 seconds, the session will be killed**, and the login screen will be shown once the device is reconnected.

Running 3D Applications

Userful MultiSeat 4.0 offers 3D software rendering and therefore can run applications that do not require hardware acceleration, such as Google Earth, K3DSurf and KSudoku. Please note that 3D graphics performance improves with more powerful CPUs. For optimal performance, avoid simultaneously running more 3D applications than the number of CPU cores in the host machine (i.e. a quad core CPU is best suited to run a maximum of 4 simultaneous 3D applications).

Auto-login

Auto-login essentially allows some pre-determined user account to be logged into -- automatically -- when a computer boots up. Be aware that because this eliminates the need for user sign-in IDs and passwords it could pose a security risk in some multi-seat configurations.

However, the Auto-login feature is ideal for use with multi-seat kiosk arrangements, as any program can be started automatically on any station.

To maintain system security and ensure administrator access, auto-login can only be used with stations

connected to USB multiseat devices. The "onboard" station cannot be configured for auto-login.

For instructions on how to configure autologin, please see [this How To](#).

Playing Video Files

Video files can be played simply by double-clicking on the file icon. With Userful MultiSeat, this will open Totem (Ubuntu's default movie player). With Userful MultiSeat Linux, this will open the video in MPlayer.

Using the CD/DVD Drive

The CD/DVD drive on the host PC is considered to be shared storage. This means that when media is first inserted into the optical drive, it will be accessible to all users; however, only the station that mounts the drive will have access to it after it is mounted.

Using Flash Drives

USB storage devices (flash drives) will be assigned to individual stations, and accessible to that station, *only if the drive is plugged into a USB multiseat device being used by that station.*

A flash drive plugged into a USB port on the host computer, or any other port where assignment is unclear, will be treated as a shared device. This means that when the flash drive is initially plugged in, an icon (labelled "Mount (New_Volume)") will appear on *every logged-in station*, and all logged-in users will be able to mount the device. Once the flash drive is mounted (a new icon appears, "New_Volume"), only the user mounting it will have access. Flash drives must be unmounted (by clicking on the "Unmount (New_Volume)" icon).

Using Digital Cameras

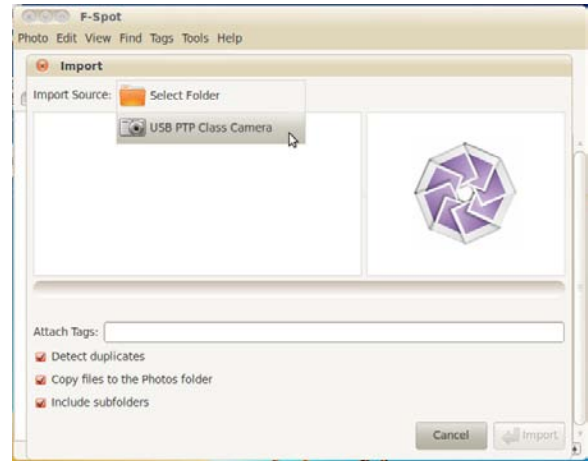

Today's digital cameras use either a mass storage protocol (like USB flash drives) or the newer Picture Transfer Protocol (PTP); many cameras can use both. Check your camera's documentation to learn which protocol it uses.

To access pictures using a mass storage protocol, simply treat the camera as a flash drive.

To access pictures using the PTP protocol, it is easiest to use picture management software.

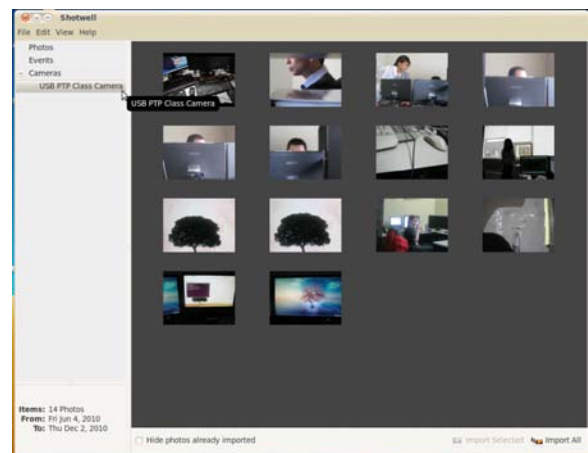

With Useful MultiSeat and/or F-Spot:

1. Connect the camera to the computer.
2. Turn on the camera.
3. Open the F-Spot Photo Manager application via Applications > Graphics > F-Spot Photo Manager
4. If the Import window is not open, click "Import".
5. Select the camera from the "Import source" drop-down list (see illustration at right).

With Useful MultiSeat Linux and/or Shotwell:

1. Connect the camera to the computer.
2. Turn on the camera.
3. Open the Shotwell Photo Manager application via Applications > Graphics > Shotwell Photo Manager
4. Select the camera from the list of sources on the left, as in the illustration to the right.

Known Issues

Known Issues Common to Multiseat Computer Systems

The following is a list of limitations shared by many multi-station or multi-seat systems, including but not limited to Useful MultiSeat.

ACPI sometimes causes X to crash at bootup

To avoid this problem, disable ACPI by changing options in the GRUB bootloader. (The method for changing bootloader options varies depending on linux distribution and GRUB version; please see our instructions on [How to Change Boot Options with the GRUB Bootloader](#).)

System instability with NVIDIA driver (using kernel 2.6.11-rc3 or lower)

There is a known issue regarding system instability using NVIDIA video drivers with kernel 2.6.11-rc3 or lower. If you experience random reboots or kernel panics using an NVIDIA driver, please ensure that your kernel version is 2.6.11-rc3 or higher.

Multimedia keys on keyboards are not supported

Utilities that enable multimedia keys in Linux may not work when multiple keyboards are connected to the system.

Userful MultiSeat 4.0: Known Issues

Onboard Audio Jack Sometimes Muted by Either AlsaMixer or PulseAudio

Occasionally it seems the audio on the onboard audio is not working, when in fact it has been muted by either [AlsaMixer](#) or [PulseAudio](#). This issue is unpredictable and difficult to reproduce; we recommend that if you are experiencing this problem you refer to AlsaMixer and PulseAudio documentation for how to adjust settings with those applications.

By Default, the Userful Control Center Cannot be Opened Without a Network Connection

If there is no network connection, the Userful Control Center will not open unless the browser is set to "Offline Mode". There is no workaround for the Chrome browser. For Firefox, the workaround is:

1. Use Firefox as the default web browser.
2. If the computer is only occasionally without a network connection:
 - Attempting to open the Control Center will cause Firefox to display a page asking the user to switch to "Offline Mode". Follow the instructions on the page and the Control Center will work as usual.
3. If the computer is regularly without a network connection, or if a more permanent fix is required:
 - Enter `about:config` in the address bar of Firefox. Scroll down the page to find `toolkit.networkmanager.disable`. Double-click the entry to change the value to "TRUE".

Full-screen Flash Video Requires Disabling Hardware Acceleration

Full-screen web-based Flash video (for example, while viewing YouTube videos) can cause Firefox to crash or freeze. Flash video can be viewed in full-screen mode, at a reduced frame rate, by disabling hardware acceleration in Flash.

Changes must be made for each user due to the way Flash settings are handled. **For each user:**

1. Right-click on the Flash application.
2. Select "Settings".
3. Go to the "Display" tab.
4. Un-check "Enable Hardware Acceleration".

5. Click on the "Close" button.

These settings will be kept until changed by the user, even after rebooting the system.

Multimedia Keyboards and USB-video Devices with Network Cards Limit the Number of Stations Possible

Multimedia keyboards (which have special keys to access the internet, music and other computer functions) register with computer systems as a number of separate "event devices", thus limiting the number of event devices available for multiseat stations. **To achieve the maximum number of connected stations, avoid using multimedia keyboards.**

Input Devices (Keyboards, Mice) Randomly Stop Working When Running More Than 8 USB Stations Plus Onboard Station

This is due to a limitation on event devices in the kernel. If these problems are experienced when using an 8+1 (or larger) system, then a custom Userful-patched kernel is required. Please see [Appendix C](#) of the User Guide for more details, including download and installation instructions for the Userful-patched kernel.

Session Lock Feature Disabled to Avoid Blocking Input Device Manual Assignment Screen

Session Lock is a security feature available on some Linux distributions; when the system is idle long enough for the screensaver to appear, the user's password will be required to re-open the session.

However, with Userful MultiSeat 4.0, on the rare occasion that a station loses keyboard/mouse device assignment and then the screensaver turns on, the authentication dialog box will block access to the Press-F-Key screen. Therefore, for Userful MultiSeat 4.0 the Session Lock feature has been disabled as a workaround.

Note: Users created after Userful MultiSeat is installed will not benefit from the workaround until they have logged in, logged out and logged back in once; until then the Session Lock feature will be available to those users.

Rarely, USB-connected Monitors Lose the Signal and Go Blank

Certain USB multiseat devices occasionally lose their signal and go blank. This seems to be caused when fluctuations in the USB signal prompt the system to switch the device to the USB 1.1 protocol (which does not support USB-video devices due to insufficient bandwidth). It may also occur when USB multiseat devices are hotplugged rapidly. The workaround:

1. Unplug the USB multiseat device from the computer.
2. Wait for 45-60 seconds to allow your session to reset (please note you will lose any unsaved work)
3. Replug the USB multiseat device into the computer and re-login.

Log-in Screen Freezes and Experiences Long Delays with 32-bit Version of Useful MultiSeat

For 32-bit Useful MultiSeat a custom Useful-patched version of GDM (the Gnome Display Manager) is required (This package is included in the Useful MultiSeat Linux installation DVD). This package can be downloaded from [Userful's website](#) (the checksum is [here](#)). The Useful-patched GDM file should be saved to the Desktop, and can be installed with the package manager simply by double-clicking the package icon.

Without the custom GDM package, the log-in screen experiences frequent long delays and freezing.

Chinese, Japanese and Korean Text Displayed Incorrectly

[CJK Characters/Fonts](#) may display incorrectly, with black boxes instead of font characters, due to a problem with fontconfig settings. The workaround is:

1. Open a terminal, and change to the font configuration directory:

```
$ cd /etc/fonts/conf.d
```

2. Enter the following:

- For Traditional Chinese (zh_TW)

```
$ sudo mv 69-language-selector-zh-tw.conf 48-language-selector-zh-tw.conf
```

- For Simplified Chinese (zh_CN)

```
$ sudo mv 69-language-selector-zh-cn.conf 48-language-selector-zh-cn.conf
```

- For Japanese (ja_JP)

```
$ sudo mv 69-language-selector-ja-jp.conf 48-language-selector-ja-jp.conf
```

- For Korean (South Korea) (ko_KR)

```
$ sudo mv 69-language-selector-ko-kr.conf 48-language-selector-ko-kr.conf
```

Note: If variant Chinese language packs such as *zh_HK* are installed and selected, some text strings will be displayed in Simplified Chinese only, regardless of language settings. To always display in Traditional Chinese, please remove *zh_HK*, and use language pack *zh_TW* instead.

Userful MultiSeat LinuxTM 2011: Known Issues

X Crashes and Restarts on MCT-device Connected Stations When Streaming DVD with "watch-dvd"

Driver segmentation faults seem to be causing X to die on stations when viewing streaming DVD on MCT devices using the Useful MultiSeat Linux "watch-dvd" function. There is no workaround at this time.

User Cannot Fully Change Session Language From Log-in When Useful MultiSeat Linux is Installed in Language Other Than English

From the Ubuntu/Edubuntu login screen, users are supposed to be able to choose a session language; however when Useful MultiSeat Linux is installed in a language other than English, and a user chooses a session language other than the system language, user interface translations are not working. Only the date will appear in the user's chosen session language. All else will be in the system language.

The workaround is for an administrator to change the system language using the Language Selector, accessed through Administration > Language Support. Please see [How to Change System Language](#) for more information.

iTALC: "ISD Server" Error Message can be Disregarded

Occasionally when running Useful MultiSeat Linux, an error message stating "ISD server could not be started..." will appear. This is due to iTALC competing for a port with another application. This error does not affect system operation, and can be closed without further action.

iTALC: Student Stations Must be Added to Teacher's Control Screen Manually with 64-bit Useful MultiSeat Linux

When the iTALC Master opens, it should automatically detect all stations on the subnet with the italc-client package installed (provided they have the same keys). This is not working with 64-bit Useful MultiSeat Linux. Student stations can be added to the Master control screen manually; please see [How To Use iTALC with Useful MultiSeat](#) for instructions.
