
IntelliVue MP2 Patient Monitor

Philips M8102A Technical data sheet

The IntelliVue MP2 portable patient monitor is compact in size, ergonomic, and modular in design. It provides an easy-to-use touchscreen user interface, is highly customizable and shares a technological platform with the Philips IntelliVue MP5-MP90 patient monitors.

The IntelliVue series offers a complete monitoring solution that is flexible and modular, designed to suit a broad spectrum of monitoring needs.

Measurement Features

- Compact, rugged, lightweight monitor with built in measurements.
- ECG monitoring using any combination of three to 10 electrodes.
- 12-lead ECG monitoring with five electrodes using the EASI method or with 10 electrodes using the conventional method.
- Multi-lead arrhythmia and ST segment analysis at the bedside on all available leads.
- Mainstream or Sidestream CO_2
- Choice of FAST SpO_2 or Nellcor™ OxiMax™ SpO_2[1]
- Invasive Pressure and Temperature measurement
- The monitor can operate using battery power for up to 3 hours with basic monitoring configuration to let you safely and easily monitor patients during

in-hospital transfer. AC power is provided by an external power supply.
- Telemetry devices can be connected via short range radio to monitor telemetry data (ECG/SpO_2) on the MP2 screen (Telemetry as a parameter (TAAP)).
- IntelliVue Cableless Measurement Devices can be connected via short range radio to monitor data from the IntelliVue CL SpO_2 Pod or IntelliVue CL NBP Pod on the MP2 screen. The Cableless Measurement Devices can also be controlled from an assigned MP2 via short range radio.

Usability Features

- Touchscreen and hardkeys as input device.
- Intuitive user interface.
- Simple menu hierarchy gives fast access to all basic monitoring tasks.
- Patient data management with tabular and graphic trends.
- Settings "Profiles" for rapid case turnover.
- Patented automatic alarm limits help clinicians provide care more efficiently.
- 3.5" TFT flat panel display with QVGA (320 x 240) resolution, wide viewing angle, large numerics, permanently visible alarm limits, and up to three real-time waves.
- Capable of functioning in a wireless infrastructure (IIT)

Intended Use

The monitor is intended to be used for monitoring and recording of, and to generate alarms for, multiple physiological parameters of adults, pediatrics, and neonates in a hospital environment and during patient transport inside and outside of hospitals. The MP2 when used with the TRx4841A/TRx4851A IntelliVue Telemetry System Transceiver is intended for use in a hospital environment and during patient transport inside the hospital environment.
The monitor is intended for use by health care professionals.
The monitor is only for use on one patient at a time. It is not intended for home use. Not a therapeutic device.
Rx only: U.S. Federal Law restricts this device to sale by or on the order of a physician.
ST segment monitoring is intended for use with adult patients only and is not clinically validated for use with neonatal and pediatric patients.
The ECG measurement is intended to be used for diagnostic recording of rhythm and detailed morphology of complex cardiac complexes (according to AAMI EC 11).

Hospital Environment:

The monitor is suitable for use in all medically used rooms which fulfill the requirements regarding electrical installation according to IEC60364-7-710 "Requirements for special installations or locations - Medical locations", or corresponding local regulations.

Upgradability

The MP2 monitor allows new capabilities to be added in the future as your monitoring requirements evolve. This upgradability gives the security of knowing that the monitors can be enhanced and updated as practices and technologies advance, and it protects long-term investments.

Main Components

Monitor

The monitor has a color LCD TFT display with a wide viewing angle, providing high resolution waveform and data presentation.
The display, processing unit and measurements are integrated into one device. An external power supply provides power for the monitor.

User Interface

The user interface is designed for fast and intuitive operation. The color graphical user interface ensures that clinicians quickly feel at ease using the monitor.
Configurable SmartKeys with intuitive icons allow monitoring tasks to be performed quickly and easily, directly on the monitor screen.
Waves and numerics are color-coded.
The monitor displays up to three measurement waves simultaneously. For 12-lead ECG monitoring it can display 12 real-time ECG waves, with a rhythm strip and all ST values.
Flexible screen layout allows optimal use of the available display space, for example, waves can be overlapped or wave size can adjust dynamically depending on the number of waves configured for the space.
The MP2 monitor is supplied with a resistive touchscreen.

Simulated Keyboard

If alpha or numeric data entry is required, for example to enter patient demographics, an on-screen keyboard will automatically appear on the screen.

Mounting

The mounting options available enable flexible, space saving placement of the monitors for an ergonomic work space. The monitor is shipped with a low cost mounting plate if not specified otherwise.

Application Features

Critical and Cardiac Care Features

- The monitor performs multi-lead **arrhythmia detection** analysis on the patient's ECG waveform at the bedside. It analyzes for ventricular arrhythmias, calculates heart rate, and generates alarms, including asystole, bradycardia, and ventricular fibrillation.

- Up to 12 leads of **ST segment analysis** can be performed on adult patients at the bedside, measuring ST segment elevation and depression and generating alarms and events. The user can trend ST changes, set high and low alarm limits, and set both ST and isoelectric measurement points. Using ST Snippets, one-second wave segments can be compared with a baseline segment for each measured ST lead.
- optional **ST Map** application shows ST changes over time in two multi-axis spider diagrams.
- ***QT/QTc interval monitoring*** provides the measured QT interval, the calculated heart-rate corrected QTc value and a ΔQTc value, which tracks variation in the QT interval in relation to a baseline value.
- optional **12-lead ECG** data can be measured, using either the EASI placement method with five standard electrodes or conventional electrode placement with 10 electrodes.[1]
  12 realtime ECG waveforms can be displayed simultaneously.
  Diagnostic 12-lead ECG can be captured, reviewed and stored on the patient monitor before it is sent to the Information Center. Local printout is available, in harmonized layout.
- High performance pulse oximetry technologies perform accurately even in cases with low perfusion.
- Choice of sidestream or mainstream **CO_2 monitoring** for high quality measurements with intubated and non-intubated patients.
- ***Telemetry devices*** (TRx4841A/TRx4851A TRx/TRx+ IntelliVue Transceiver) can be connected via short range radio to the MP2 to monitor telemetry data (ECG/SpO_2) on the MP2 screen.

Ease of Use

- **Screen layouts** are easily adjustable, allowing flexible display of measurement information.
- Temperature, height, and weight can be configured either in metric or imperial **units**. Pressure measurements can be displayed in kPa or mmHg. Gases can be displayed in kPa, mmHg.

Trends

- The **trend database** stores patient data from up to 16 measurement numerics. The measurement information can be sampled every 12 seconds, one minute, or five minutes, and stored for a period ranging from four to 48 hours.
  – Each NBP measurement generates a column in the Vital Signs trend table. The values for the other measurements are added to provide a complete vital signs set for the NBP measurement time.
- ***Horizon Trends*** show the deviation from a stored baseline.

[1] EASI-derived 12-lead ECGs and their measurements are approximations to conventional 12-lead ECGs. As the 12-lead ECG derived with EASI is not exactly identical to the 12-lead conventional ECG obtained from an electrocardiograph, it should not be used for diagnostic purposes.

Transport Features

- The monitor's portable design means it can be used for in and out-of-hospital transport: a basic monitor weighs 1.5 kg.
- The monitor can operate using battery power for up to 3 hours, to let you safely and easily monitor patients during procedures or in-hospital transfer.
- Specially-designed mounting solutions let you quickly disconnect the monitor for transport and reconnect to the mount after transport.
- The Universal Admit, Discharge and Transfer (ADT) feature means that all ADT information is shared between the networked monitor and the Information Center. Information need only be entered once.

Patient Data Documentation

- An extensive range of **Patient Reports** can be printed:
  – 12-lead ECG Reports
  – Alarm Limit Reports
  – Vital Signs
  – Graphic Trends
  – Realtime Wave Reports
  Report templates can be defined in advance, enabling print-outs tailored to each hospital's specific requirements to be started quickly. Reports can be printed on centrally-connected printers or via the IntelliVue PC Printing Solution, and they can be initiated manually or automatically at user-defined intervals.
- The IntelliVue PC Printing Solution allows printing of reports, waveform captures and trends from the MP2 to a standard off-the shelf printer or to an electronic file.

Alarms

The alarm system can be configured to present either the traditional HP/Agilent/Philips alarm sounds or sounds compliant with the IEC 60601-1-8 Standard.
Alarm limits are permanently visible on the main screen. The Alarm Limits page provides a graphic depiction of alarm limits in relation to the currently monitored measurement values and lets you adjust alarm limits. It also lets you preview wide and narrow automatic alarm limits before you apply them.
When an alarm limit is exceeded, it is signalled by the monitor in the following ways:

- an alarm tone sounds, graded according to severity
- an alarm message is shown on the screen, color-coded according to severity
- the numeric of the alarming measurement flashes on the screen
- alarm lamps flash for red and yellow alarms and are illuminated for technical INOPs

A "SmartAlarm Delay" algorithm helps to reduce the number of pulse oximetry nuisance alarms.[2]

If the monitor is connected via a network to a central monitoring station, alarming is simultaneous at the monitor and at the Information Center.

Alarms are graded and prioritized according to severity:

- **Red Alarms*** ** identify a potentially life threatening situation for a patient.
- **Yellow Alarms**** indicate conditions violating preset vital signs limits.
- **Technical Alarms (INOPS)** are triggered by signal quality problems, equipment malfunction or equipment disconnect.

The Silence/Pause Alarms function (equivalent to Silence/Suspend with previous monitor generations) allows the user to switch off alarm tones with one touch.

All alarms can be paused for a period of one, two, three, five, or 10 minutes or turned off indefinitely.

Alarm strip recordings are available on a centrally-connected recorder or via the IntelliVue PC Printing Solution.

Patented automatic alarm limits automatically adapt the alarm limits to the patient's currently measured vital signs within a safe margin defined individually for each patient.

Visual and/or audible latching and non-latching alarm handling is available.

Profiles

Profiles are predefined configuration settings for Screens, measurement settings, and monitor settings. Each Profile can be designed for a specific application area and patient category, for example OR adult, or ICU neonatal. Profiles enable a quick reaction to patient and care location changes: activating a Profile with a particular patient category (Adult, Pediatric or Neonatal) automatically applies suitable alarm and safety limits and saves time usually spent carrying out a complete set-up procedure.

Profiles can be created directly on the monitor or remotely on a personal computer and transferred to the monitor using the IntelliVue Support Tool. A selection of Profiles for common monitoring situations is provided with the monitor. These profiles can be changed, added to, renamed, or deleted.

Optional Networking Capabilities

The monitor can operate as part of a wired or wireless hospital network system, using the Philips IntelliVue Clinical Network interface. This includes:

- DHCP protocol support (as an alternative to BootP in certain network designs)
- 802.1x basic support on wireless networks
- WMM on wireless networks
- QoS Tagging

Service Features

- The Support Tool helps technical personnel to
  - carry out configuration, upgrades and troubleshooting via the network, or on an individual monitor
  - share configuration settings between monitors
  - back up the monitor settings.
- A password-protected Service Mode ensures that only trained staff can access service tests and tasks.
- The Configuration Mode is password-protected and allows trained users to customize the monitor configuration.

Device Connections

The monitor can be connected to:

- an Information Center (for example M3150B)
- a PC
- MMS Extensions (M3012A, M3014A, M3015A/B,)[1]

Network Interface

The network interface provides the system with networking capability via a wired or wireless network connection.

Wireless Network

The monitor can function within a wireless infrastructure based on an IEEE 802.11 a/g network in the 2.4 GHz / 5 GHz bands (ISM). Additionally, the monitor can function within a telemetry infrastructure compatible with the Philips Cellular Telemetry System (CTS) in the WMTS and ISM bands. Additional components are required to complete the system. Please refer to the M3185A IntelliVue Clinical Network Technical Data Sheet for further information.

A short range radio interface for an IEEE 802.15.4 network in the 2.4 GHz (ISM) band is also available. This allows a telemetry device with a short range radio adapter or IntelliVue Cableless Measurement Devices to be assigned to the monitor.

Monitor Specifications

Safety Specifications

The monitor complies with the Medical Device Directive 93/42/EEC (CE_{0366}) and with IEC 60601-1:1988 + A1:1991 + A2:1995; EN60601-1:1990 + A1:1993 + A2:1995; UL 60601-1:2003; CAN/CSA

[2] The "SmartAlarm Delay" is not available in the U.S.A. and territories relying on FDA Market clearance.
The Smart Alarm Delay functionality is currently not available in China or in clinical environments under SFDA control.

[1] The MMS Extensions will only function when they are connected to the Philips Battery Extension, or the monitor is connected to external power.

C22.2#601.1-M90 + Suppl. No 1-94 + Am.2; JIS T 0601-1:1999; IEC 60601-1-1:2000; EN 60601-1-1:2001.
All applied parts are Type CF unless otherwise specified. They are protected against damage from defibrillation and electrosurgery.
The possibility of hazards arising from software errors was minimized in compliance with ISO 14971:2000, EN60601-1-4:1996 + A1:1999 and IEC 60601-1-4:1996 + A1:1999.
The monitor complies with the EMC standards
IEC 60601-1-2:2001; EN 60601-1-2:2001
This ISM device complies with Canadian ICES-001. Cet appareil ISM est conforme à la norme NMB-001 du Canada.
The MP2 patient monitor with measurements and interfaces other than those listed below cannot be used for patient transport outside of the hospital environment.
The MP2 patient monitor with the following measurements and interfaces:

- ECG/Respiration, NBP, SpO_2, Pressure, Temperature, CO_2[1]
- LAN, Battery

can be used in a transport environment such as road ambulance, airplane or helicopter. For this purpose, the monitor fulfills the following additional mechanical, EMC and environmental requirements:

- ***Shock Tests*** according to IEC TR 60721-4-7, Class 7M3. Test procedure according to IEC/EN 60068-2-27 (peak acceleration up to 100g).
- ***Random Vibration*** according to IEC TR 60721-4-7, Class 7M3. Test procedure according to IEC/EN 60068-2-64 (RMS acceleration 5g).
- ***Sinusoidal Vibration*** according to IEC TR 60721-4-7, Class 7M3. Test procedure according to IEC/EN 60068-2-6 (acceleration up to amplitude 2g).
- ***Bump Test*** according to IEC/EN60068-2-29 (peak acceleration 15g, 1000 bumps).
- ***Free Fall Test*** according to EN1789 (covers also IEC TR 60721-4-7 and Class 7M3). Test procedure according to EN 60068-2-32 (height 0.75 m).
- Specification for degrees of protection provided by enclosures according to ***IEC/EN 60529: IP 32***
- ***EN 1789 +A1:2003*** Medical vehicles and their equipment - Road ambulances (chapter 6 - Medical Devices).
- ***EN13718-1*** Air, water and difficult terrain ambulances. Medical devices interface requirements for the continuity of patient care. For Ambulances, Patient transport equipment, Emergency vehicles, Ambulance services, Rough-terrain vehicles, Water transport, Air transport, Medical equipment, Medical instruments, Interfaces, Performance.
- ***Radiated susceptibility 20 V/m*** according to EN ISO 9919 (SpO_2) and EN ISO 21647 (CO_2).
- ***Altitude Range*** from -500 to 3000 m operating and -500 to 4600 m storage and transportation.
- Extended radiated susceptibility tests

The MP2 patient monitor with its out-of-hospital parameter set provides a general immunity level of 20 V/m with only few restrictions. Details are as listed below:

- GSM 900: Immunity at 900 MHz (uplink mobile phone), 20 V/m, duty cycle 1:8
- GSM 1800: Immunity at 1800 MHz (uplink mobile phone), 20 V/m, duty cycle 1:8.
- DECT: Immunity at 1800 MHz (digital cordless phone), 20 V/m, duty cycle 1:24
- AM: 1 kHz Immunity from 80 MHz to 2.5 GHz (any radio communication unit, broadcasting and TV transmitter), 20 V/m, modulation factor 80%. (ECG: 20 V/m except 0.8-1.2 GHz where it is 10 V/m)

- ***Operating ambient temperature*** testing over the range from 0°C to 40°C (32°F to 104°F).
- ***Operating ambient humidity*** testing up to 95% RH at 40°C (104°F), non condensing.

US Army Airworthiness Certification Granted

- U.S. Army Airworthiness Certification and Evaluation (ACE) program of U.S. Army Aeromedical Research Laboratory (USAARL)
- Tests performed in accordance with the following standards:
  - MIL-STD-461E Electromagnetic interference characteristics requirements and limits.
  - MIL-STD-810F Department of Defense test method standard for environmental engineering considerations and laboratory tests.
  - MIL-STD-1472F Human Engineering.
  - ANSI/AAMI HE48-1993 HF Engineering guidelines & preferred practices for the design of medical devices.
  - ANSI/AAMI ES1-1993 Safe current limits for electromedical apparatus.

[1] The MP2 Patient Monitor in combination with the M2741A LoFlo CO_2 Sensor meets CISPR 11, Group 1, Class A emission limits. Thus it is suitable only for use in all establishments other than domestic and those connected to a low power network which supplies buildings used for domestic purposes.

Heart Rate Averaging Method		Three different methods are used: Normally, heart rate is computed by averaging the 12 most recent RR intervals. For runs of PVCs, up to 8 RR intervals are averaged to compute the HR. If each of 3 consecutive RR intervals is greater than 1200 ms (that is, rate less than 50 bpm), then the 4 most recent RR intervals are averaged to compute the HR.
Response Time of Heart Rate Meter to Change in Heart Rate		HR change from 80 to 120 bpm: Range: [6.4 to 7.2 seconds] Average: 6.8 seconds HR change from 80 to 40 bpm: Range: [5.6 to 6.4 sec] Average: 6.0 seconds

Philips FAST SpO_2

Complies with EN ISO 9919:2005 (except alarm system; alarm system complies with IEC 60601-2-49:2001).

Measurement Validation: The SpO_2 accuracy has been validated in human studies against arterial blood sample reference measured with a CO-oximeter. Pulse oximeter measurements are statistically distributed, only about two-thirds of the measurements can be expected to fall within the specified accuracy compared to CO-oximeter measurements. Display Update Period: Typical: 2 seconds, Maximum: 30 seconds. Max. with NBP INOP suppression on: 60 seconds. For SpO_2 specifications of a connected telemetry device, see the specifications document of the telemetry device.

a Specification applies to Monitor performance. Reading accuracy in the presence of low perfusion (detected IR pulse modulation amplitude 0.03% - 1.5%) was validated using signals supplied by a patient simulator. SpO_2 and pulse rate values were varied across the monitoring range over a range of weak signal conditions and compared to the known true saturation and pulse rate of the input signals.

The specified accuracy is the root-mean-square (RMS) difference between the measured values and the reference values.

a M1901B/MAXN:
Clinical functionality has been demonstrated on a population of hospitalized neonate patients. The observed SpO_2 accuracy was 2.5% in a study of 42 patients with ages of 1 to 23 days, weight from 750 to 4100 grams, and 63 observations made spanning a range of 85 to 99% SaO_2 while monitored with Nellcor OxiMax N-595 pulse oximeters.

b The accuracy specification has been determined between saturations of 80%–100%.

c SoftCare SC-PR-I, SCNEO-I:
Clinical functionality has been demonstrated on a population of hospitalized neonate and infant patients. The observed SpO_2 accuracy was 3.0% in a study of 57 patients with ages of 24 to 40 weeks, weight from 710 to 5,000 grams, and 185 observations made spanning a range of 63 to 100% SaO_2 while monitored with Nellcor OxiMax N-595 pulse oximeters.

d Neonatal accuracy: When sensors are used on neonatal subjects as recommended, the specified accuracy range is increased by ± 1 digit, as compared to adult usage, to account for the theoretical effect on oximeter measurements of fetal hemoglobin in neonatal blood. For example, OxiCliq N accuracy on neonates is ± 3.5 digits, rather than ± 2.5.

NBP

Complies with IEC 60601-2-30:1999/EN60601-2-30:2000.

Measurement Validation: In adult and pediatric mode, the blood pressure measurements determined with this device comply with the American National Standard for Electronic or Automated Sphygmomanometers (ANSI/AAMI SP10 - 1992) in relation to mean error and standard deviation, when compared to intra-arterial or auscultatory measurements (depending on the configuration) in a representative patient population. For the auscultatory reference the 5th Korotkoff sound was used to determine the diastolic pressure.
In neonatal mode, the blood pressure measurements determined with this device comply with the American National Standard for Electronic or Automated Sphygmomanometers (ANSI/AAMI SP10 - 1992 and AAMI/ANSI SP10A -1996) in relation to mean error and standard

deviation, when compared to intra-arterial measurements in a representative patient population.

Operating Temperature		0°C to 40°C (32°F to 104°F)

M3014A Mainstream and Sidestream CO_2 Humidity Correction Factor

Either BTPS or STPD can be selected as the humidity correction factor for the CO_2 readings. The formula for the correction calculation is:

$$P_{STPD} = P_{BTPS} \cdot \frac{P_{abs}}{P_{abs} - P_{H2O}}$$

Where p = partial pressure, P_{abs} = absolute pressure, and P_{H2O} = 42 mmHg @35°C and 100% RH.

Mainstream CO_2 Humidity Correction Factor

Either BTPS or STPD can be selected as the humidity correction factor for the Mainstream CO_2 readings. The formula for the correction calculation is:

$$P_{STPD} = P_{BTPS} \cdot \frac{P_{abs}}{P_{abs} - P_{H2O}}$$

Where p = partial pressure, P_{abs} = absolute pressure, and P_{H2O} = 47 mmHg @37°C and 100% RH.
