Introduction

Split System Cooling Units . . . Designed With Your Needs In Mind.

The Trane reputation for quality and reliability in air conditioning continues with the Odyssey™ family of light commercial split systems. Trane paid attention to your needs to make sure you get a system that will meet your job requirements every time...and at a competitive price.

Couple Trane's reputation for quality and reliability in split system air conditioners with efficiency, flexibility and installation ease...and you have systems that will give you "Simply the Best Value."

Manufacturing Control

Trane's exclusive control over the design and manufacturing of all major components is unique in the industry. This approach assures us total control over both the quality and reliability of these components. And allows us to custom match components to deliver the best in split system performance.

Designing the Details

Careful attention was given to designing the details — from control wiring to the access panels. Odyssey units feature time-saving colored and numbered wiring and removable panels which allow complete access to all major components and controls. All outdoor units feature external high and low pressure switches for easy diagnosing and servicing of the unit. And service valves with gauge ports are provided.

Standardized Cabinets

In addition all cabinets have been standardized; so when you are servicing an outdoor unit or an air handler all components are in the same location from unit to unit.

Filters

The TWE050, 075, and 100 air handlers are supplied with 1" (25.4 mm) throwaway filters as standard. The filter racks were designed to easily convert for installation of 2" (50.8 mm) filters. The TWE155 and 200 air handlers are supplied with 2" (50.8 mm) filters as standard.

Rated in Accordance to UL and ARI

Trane meets or exceeds all nationally recognized agency safety and design standards. Each condensing unit is designed in accordance to UL 1995 standards for central cooling air conditioners, refrigeration and air conditioning condensing and compressor units. Each air handler is designed in accordance to UL 465 and UL 1995 standard for heat pumps. Each unit is certified in accordance with ARI Standard 340/360 or 365.

Features and Benefits

Condensing Unit Options

The Odyssey split system product line includes condensing units in single, unloading and dual compressor options.

The TTA075A, 085A and 100A single compressor models feature single refrigeration circuitry lowering job installation costs by requiring only one set of refrigerant lines. These units are ideal for the low cost, new construction jobs as well as renovation and replacement buildings.

Equally important, Odyssey offers a single refrigerant circuit/capacity unloading option in TTA100C, 155C, and TWE200F condensing units. These unloading units feature dual manifolded scroll compressors. They offer an excellent opportunity for both new construction and replacement jobs with two stages of capacity modulation and a single refrigeration circuit.

In addition, Odyssey includes a TTA100B, 125B, 155B, and 200B dual scroll compressor unit to give true stand-by protection; if one compressor fails, the second will automatically start-up. Also, the first compressor can be serviced without shutting down the

unit since refrigerant circuits are independent.

Dual compressors are not just for protection, they also save energy costs. Most buildings are designed for the peak load requirements yet the building usually operates at less than peak load. During light load conditions only one compressor functions to maintain the space comfort thus reducing the need for energy.

Trane split systems have been specified in thousands of applications and you'll find Odyssey will win you even more jobs with its smaller, more manageable cabinet. This lighter, compact design will save time and money for rigging and installation. And the compactness will permit Trane's unit to replace almost any unit — effortlessly.

Low Ambient Cooling Operation

Each condensing unit can operate to 50°F (10°C) as standard. An accessory Head Pressure Control gives you the capability to operate to 0 F (-17.8°C). All condensing units offer these accessories:

- Head Pressure Control
- Coil Guard Kits
- Isolators both Rubber-in-Shear and Spring Type
- Anti-Short-Cycle Kit
- Time Delay Relay
- Black Epoxy Coated Coil

Air Handlers Offer More Flexibility

Flexibility is a key to meeting changing market requirements. Odyssey split systems offer not only various compressor options but also convertible air handlers. The air handlers can be installed either vertically in a mechanical room or horizontally above a ceiling. And it doesn't require any removal of panels to make either airflow application work. These air handlers have a double sloped condensate drain pan that allows for either airflow configuration. And the drain pan can easily be removed for cleaning. All the air handlers feature factory-installed belt drive and ball bearing evaporator fans with adjustable sheaves for maximum airflow performance.

Features and Benefits

Odyssey air handler versatility is further increased by a complete line of accessories designed to match and install smoothly:

- Discharge Plenum and Grille
- Return Grille
- Subbase
- Electric Heaters
- High Static Evaporator Motor
- Isolators both Rubber-in-Shear and Spring Type
- A Full Line of Thermostats
- Outdoor Thermostat

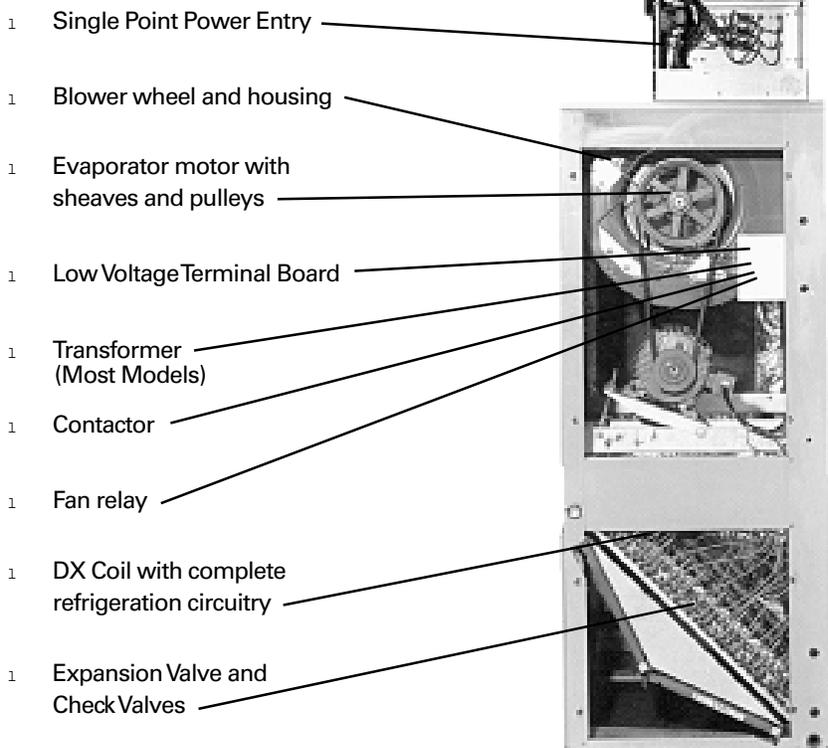

Odyssey — A Complete Split System

Odyssey delivers the flexibility to select a complete system that meets your particular job requirements. Air handlers are designed, tested, and rated with outdoor units to let you select the proper match between capacity and load. Heat pumps can also be matched with Trane built-up air handlers. Also, these matched systems can be quickly engineered for specific applications using Trane's computerized selection and load programs.

Odyssey Lowers Installation Costs

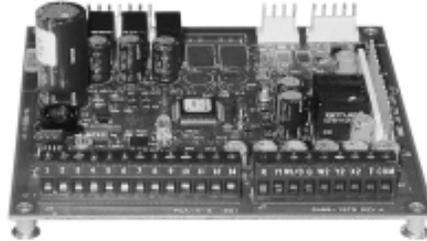

Your installation costs are reduced with Odyssey. Both outdoor units and air handlers are factory packaged and assembled so jobsite installation is quick and easy. You get a complete unit with all the components, controls and the internal wiring factory ready for a smooth jobsite start-up.

Unlike some competitive models the following components are factory-installed in Trane air handlers:

There's no need to install components and put together the air handler on the job. This provides you with less labor cost and fewer chances for installation errors which cause callbacks. All this means saving you money both in replacement and new construction applications.

Features and Benefits

Micro Controls

Several years ago, Trane was the first to introduce microprocessor controls into the Light Commercial Market. That design, along with immeasurable experience, has provided the technology for Trane's second-generation ReliaTel™ microprocessor controls in Odyssey split unit systems — the first in the industry.

ReliaTel™ Micro:

- Provides unit control for heating and cooling, by utilizing input from sensors that measure indoor temperature.
- Improves quality and reliability through the use of time-tested microprocessor controls and logic.
- Prevents the unit from short cycling, considerably improving compressor life.
- Ensures that the compressor will run for a specific amount of time, which allows oil to return for better lubrication, enhancing the reliability of the compressor.
- Reduces the number of components required to operate the unit, thereby reducing possibilities for component failure.
- Eliminates the need for field-installed components with its built-in anti-short-cycle timer, time delay relay and minimum "on" time controls. These controls are factory tested to assure proper operation.

- Requires no special tools to run the unit through its paces during testing. Simply place a jumper between Test 1 and Test 2 terminals on the Low Voltage Terminal Board and the unit will walk through its operational steps. The unit automatically returns control to the zone sensor after stepping through the test mode a single time, even if the jumper is left on the unit.
- As long as the unit has power and the LED is lit, the Micro is operational. The light indicates that the Micro is functioning properly.
- Features expanded diagnostic capabilities when used with Trane's Integrated Comfort™ Systems.
- As an energy benefit, softens electrical "spikes" by staging on fans, compressors and heaters.
- The Intelligent Fallback or Adaptive Control is a benefit to the building occupant. If a component goes astray, the unit will continue to operate at predetermined temperature set points.
- Intelligent Anticipation is a standard feature of the Micro. Functioning constantly, the Micro and zone sensors work together in harmony, to provide tight comfort control.

Electromechanical Controls

- For the simpler job that does not require a building automation system, or expanded diagnostics capabilities, the unit offers electromechanical controls. This 24-volt control includes the control transformer, contactor pressure lugs for power wiring.

Features and Benefits

Quality And Reliability Testing

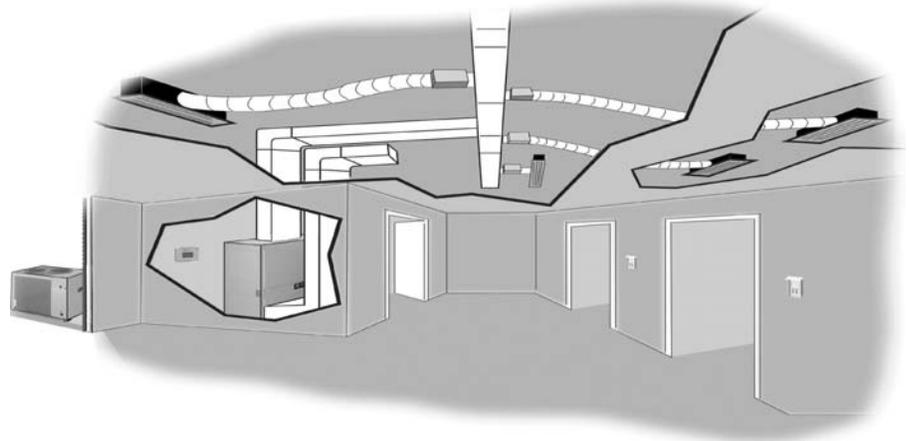

- All units were rigorously rain tested at the factory to ensure water integrity.
 - Actual shipping tests were performed to determine packaging requirements. Units were test shipped around the country to determine the best packaging.
 - Factory shake and drop tests were used as part of the package design process to help assure that the unit arrives at the job site in top condition.
 - Rigging tests include lifting a unit into the air and letting it drop one foot, assuring that the lifting lugs and rails hold up under stress.
- We perform a 100% coil leak test at the factory. The evaporator and condenser coils are leak tested at 375 psig and pressure tested to 660 psig.
 - All parts are inspected at the point of final assembly. Sub-standard parts are identified and rejected immediately.
 - Every unit receives a 100% unit run test before leaving the production line to make sure it lives up to rigorous Trane requirements.

We test designs at our factory not on our customers!

VariTrac™

VariTrac

When Trane's changeover VAV System for light commercial applications is coupled with split unit systems, it provides the latest in technological advances for comfort management systems and can allow thermostat control in every zone served by VariTrac.

Application Considerations

Application of this product should be within the catalogued airflow and performance considerations.

Clearance Requirements

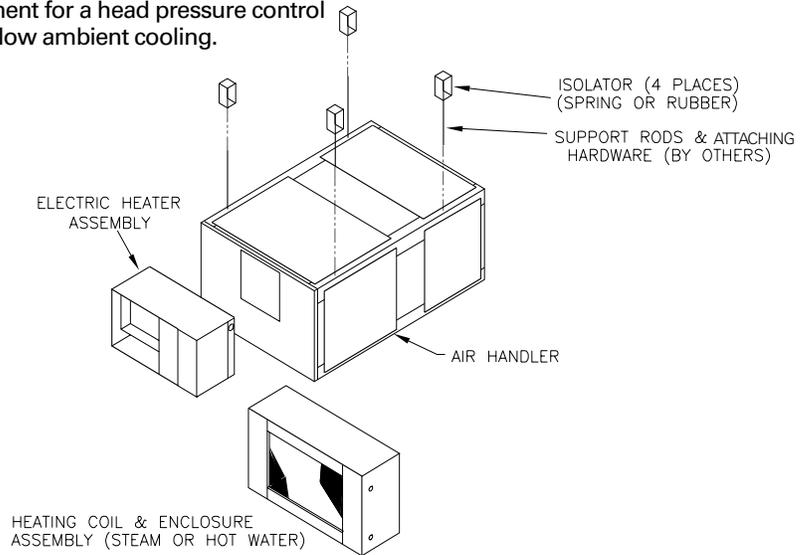

The recommended clearances identified with unit dimensions should be maintained to assure adequate serviceability, maximum capacity and peak operating efficiency. Actual clearances which appear inadequate should be reviewed with the local Trane Representative.

180° Blower Rotation

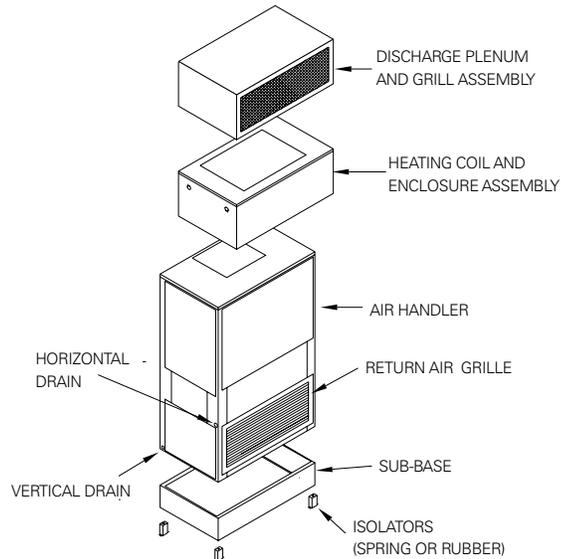

The TWE050, 075, and 100 air handler blower section can be rotated 180° to change the discharge pattern. This modification must be done in the field and requires an addition of kit. See unit installer's guide.

Low Ambient Cooling

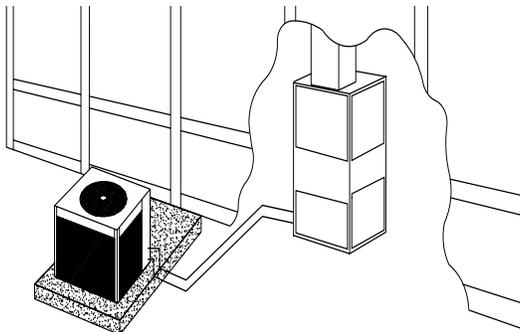

As manufactured, these units can operate to 50° F (10°C) in the cooling mode of operation. An accessory head pressure control will allow operation to 0° F (-17.8°C) outdoor ambient. When using these units with control systems such as bypass changeover Variable Air Volume, make sure you consider the requirement for a head pressure control to allow low ambient cooling.

Typical Horizontal Air Handler Application

Typical Vertical Air Handler Application

Typical Split System Application

Selection Procedure

Cooling Capacity

Step 1 — Calculate the building's total and sensible cooling loads at design conditions. Use the Trane calculation form or any other standard accepted method.

Step 2 — Size the equipment using Table PD-1. Match the cooling loads at design conditions.

Example: The following are the building cooling requirements

- a** Electrical Characteristics: 380-415/50/3
- b** Summer Design Conditions: Entering Evaporator Coil: 80 DB/67 WB (27 DB/19WB C)
Outdoor Ambient: 95° F (35° C)
- c** Total Cooling Load: 75 MBh (22 kW)
- d** Sensible Cooling Load: 53 MBh (15.5 kW)
- e** Airflow: 3000 cfm (5097 m³/h)
External Static Pressure: 0.77 in. (192.5 Pa)

Table PD-1 shows that a TTA075A matched with a TWE075A has a gross cooling capacity of 86.5 MBh (25.3 kW) and 64.4 MBh (18.8 kW) sensible capacity at 95 DB (35° C) ambient and 3000 cfm (5097 m³/h) and 80 DB/67 WB (27 DB/19WB) air entering the evaporator.

To find the net cooling capacities, fan motor heat must be subtracted. Determine the total unit static pressure:

	In.	Pa
External Static	0.77	193
Standard Filter	0.10	25
Supplementary Electric Heat	0.23	57
Total Static Pressure	1.10	275

Note: The Evaporator Fan Performance Table has included the effect of a 1 in. (250 Pa) filter already. Therefore, the actual Total Static Pressure is 1.10 - 0.10 = 1.00 in. (275 - 25 = 250 Pa).

With 3000 cfm (5097 m³/h) and 1.00 inches (250 Pa), Table PD-29 shows a 1.17 bhp (0.8 kW).

Note: The formula below the table can be used to calculate Fan Motor Heat,

$$3.5 \times \text{Bhp} = \text{MBh}$$

$$3.5 \times 1.17 = 4.10 \text{ MBh}$$

$$(1.375 \times \text{kW}) = \text{kW}$$

$$(1.375 \times 0.8 = 1.1 \text{ kW})$$

$$\text{Net Total Cooling Capacity} =$$

$$86.5 \text{ MBh} - 4.10 = 82.4 \text{ MBh}$$

$$18.8 - 1.1 = 17.7 \text{ kW}$$

$$\text{Net Sensible Cooling Capacity} =$$

$$64.4 \text{ MBh} - 4.10 = 60.3 \text{ MBh}$$

$$25.3 - 1.1 = 24.2 \text{ kW}$$

Heating Capacity

Step 1 — Calculate the building heating load.

Step 2 — Size the system heating capacity to match the calculated building heating load. The following are building heating requirements:

- a** Total Heating Load at 97.0 MBh (28.4 kW)
- b** 3000 cfm (5097 m³/h)
- c** Electric Supplementary Heaters

Table PD-39, the 34.88 kW heater has a capacity of 119,045 btu. From Table ED-5, the 34.88 kW indicates the heater model number is BAYHTRL435A. This heater will adequately cover the building's heating requirement.

Air Delivery Selection

External static pressure drop through the air distribution system has been calculated to be 0.77 inches (192.5 Pa) of water gauge. From Table PD-38 static pressure drop through the electric heater is 0.23 inches (57.5 Pa) of water (0.77 + 0.23 = 1.00 in.) (192.5 + 57.5 = 250 Pa). Enter Table 39-1 for TWE075AD at 3000 cfm (5097 m³/h) and 1.00 static pressure (250 Pa). The standard motor at 821 rpm will give the desired airflow.

Equal TGC and SHC values constitute dry coil conditions. Total Gross Cooling (TGC) shown to the left is not applicable. In this case the Sensible Heat Capacity (SHC) is the total capacity.

All capacities shown are gross and have not considered indoor fan heat. To obtain net cooling capacities subtract indoor fan heat. TGC = Total Gross Cooling Capacity SHC = Sensible Heat Capacity

Performance Data System

Table PD-8 — Gross Cooling Capacities (MBh) - Single Compressor - TTA100C Condensing Unit with TWE100A Air Handler (I-P)

Table with columns for Ambient Temperature (°F), Entering Wet Bulb (°F), and CFM. Rows include Airflow (75, 80, 85, 90) for capacities 3025, 3350, 3675, and 4000 MBh. Each cell contains TGC and SHC values for four different wet bulb conditions.

Equal TGC and SHC values constitute dry coil conditions. Total Gross Cooling (TGC) shown to the left is not applicable. In this case the Sensible Heat Capacity (SHC) is the total capacity.

All capacities shown are gross and have not considered indoor fan heat. To obtain net cooling capacities subtract indoor fan heat. TGC = Total Gross Cooling Capacity SHC = Sensible Heat Capacity

Table PD-8 — Gross Cooling Capacities (kW) - Single Compressor - TTA100C Condensing Unit with TWE100A Air Handler (SI)

Table with columns for Ambient Temperature (°C), Entering Wet Bulb (°C), and m³/h. Rows include Airflow (24, 27, 29, 32) for capacities 5139, 5692, 6244, and 6796 kW. Each cell contains TGC and SHC values for four different wet bulb conditions.

Equal TGC and SHC values constitute dry coil conditions. Total Gross Cooling (TGC) shown to the left is not applicable. In this case the Sensible Heat Capacity (SHC) is the total capacity.

All capacities shown are gross and have not considered indoor fan heat. To obtain net cooling capacities subtract indoor fan heat. TGC = Total Gross Cooling Capacity SHC = Sensible Heat Capacity

NOTES:

1. All capacities shown are gross and have not considered indoor fan heat. To obtain net cooling, subtract indoor fan heat.
2. MBH = Total Gross Capacity
3. SHC = Sensible Heat Capacity

	1.0 HP Standard Motor and Low Static Drive							1.0 HP Standard Motor and Drive							1.5 HP Oversized Motor and High Static Drive							

Notes:

- Performance based on a wet coil and 1 inch (25.4 mm) throwaway filters.
- Tabulated brake horsepower is the motor shaft output required.
- Factory setting of motor sheave is 1.5 turns open. Adjustments are made in 0.5 turn increments.

Throw distance values are based on a terminal velocity of 75 FPM (0.38 m/s).

Throw distance values at other terminal velocities may be established by multiplying throw distances in table above by throw factor:

Terminal Velocity	Throw Factor
50 fpm (.25 m/s) x	1.50
100 fpm (.51 m/s) x	.75
150 fpm (.76 m/s) x	.50

1. kW ratings are at 400v for 3 phase, 400v air handlers

For other than rated voltage, ampacity = $\left(\frac{\text{Voltage}}{\text{Rated Voltage}}\right)^2 \times \text{Rated Capacity}$ and kW = $\left(\frac{\text{Voltage}}{\text{Rated Voltage}}\right)^2 \times \text{Rated kW}$.

2. Any power supply and circuits must be wired and protected in accordance with local codes. MCA and Maximum Fuse Size is based on 400V.

3. Field wire must be rated at least 167°F (75°C).

4. Field wire must be rated at least 194°F (90°C).

Jobsite Connections

Wiring shown with dashed lines is to be furnished and installed by the customer. All customer-supplied wiring must be copper only and must conform to local electrical codes.

NOTE:

1. When electric heater accessory is used, single point power entry or dual point power entry is field optional. Single point power entry is through electric heater only.

TTA050/TWE050A

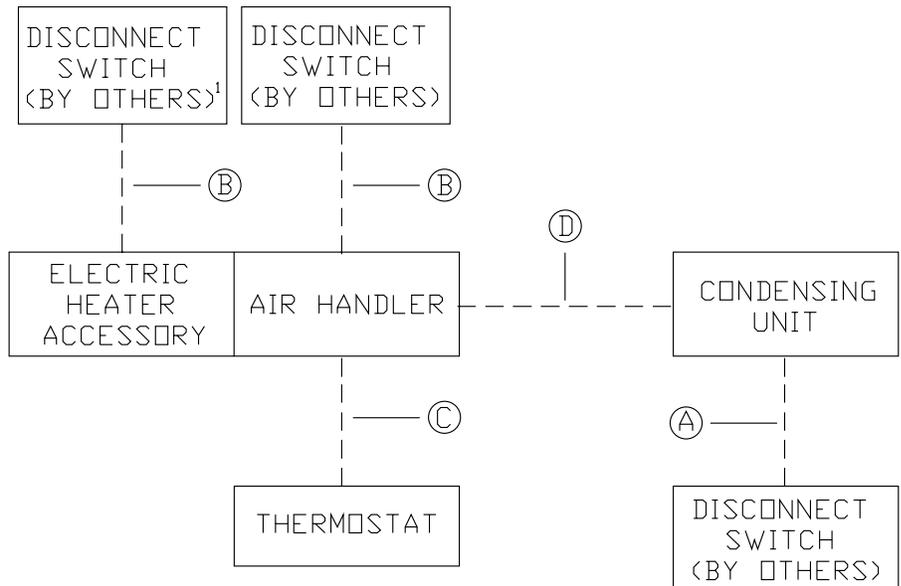

Field Wiring:

- A — 3 power wires. Line voltage for 3 phase, 2 wires for single phase.
- B — 3 power wires. Line voltage for 3 phase, 2 wires for single phase.
- C — Cooling only thermostat: 3 wires, 24 volts.
 - One-stage electric heat: add 1 additional wire, 24 volts.
 - Two-stage electric heat: add 2 additional wires, 24 volts.
- D — 2 wires, 24 volts.

(2) TTA050/TWE100B

Field Wiring:

- A — 3 power wires. Line voltage for 3 phase, 2 wires for single phase.
- B — 3 power wires. Line voltage for 3 phase, 2 wires for single phase.
- C — Cooling only thermostat: 5 wires, 24 volts.
 - One-stage electric heat add 1 additional wire, 24 volts.
 - Two-stage electric heat: add 2 additional wires, 24 volts.
- D — 2 wires, 24 volts to outdoor section "A"
 - 2 wires, 24 volts to outdoor section "B"

NOTES:

1. For use when no heat is supplied.

2. For use with electric heat.

Mechanical Specifications

Condensing Units

General

Units shall be assembled on heavy gauge steel mounting/lifting rails and shall be weather proofed. Units shall include hermetic scroll compressors, plate fin condenser coils, fans and motors, controls and holding charge of nitrogen. Operating range shall be between 115°F and 50°F in cooling as standard from the factory. Units shall be UL 1995 listed, certified and rated in accordance with ARI Standard 340/360 or 365.

Casing

Unit casing shall be constructed of 18 gauge zinc coated heavy gauge, galvanized steel. Exterior surfaces shall be cleaned, phosphatized and finished with a weather-resistant baked enamel finish. Units surface shall be tested 500 hours in salt spray test. Units shall have removable end panels which allow access to all major components and controls.

Refrigeration System – Single Compressor

TTA075A, TTA100A units shall have a single refrigeration circuit. Each refrigeration circuit has an integral subcooling circuit. A refrigeration filter drier shall be provided as standard. The TTA075A, TTA100A units shall have both a liquid line and suction gas line service valve with gauge port.

TTA075A, TTA100A units shall have one direct-drive hermetic scroll compressor with centrifugal oil pump providing positive lubrication to moving parts. Motor shall be suction gas-cooled and shall have a voltage utilization range of plus or minus 10 percent of unit nameplate voltage. Crankcase heater, internal temperature and current-sensitive motor overloads shall be included for maximum protection. Scroll type compressor shall provide inherently low vibration and noise by having no suction and discharge valves. External high and low pressure cutout devices shall be provided. Evaporator defrost control provided in indoor blower coil shall prevent compressor slugging by temporarily interrupting compressor operation when low evaporator coil temperatures are encountered.

Refrigeration System – Dual Compressor

TTA100B, TTA125B, TTA155B, TTA200B units shall have two separate and independent refrigeration circuits. Each refrigeration circuit shall have an integral subcooling circuit. A refrigeration filter drier shall be provided as standard. Units shall have both a liquid line and suction gas line service valve with gauge port.

TTA100B, TTA125B, TTA155B, and TTA200B units shall have two Trane direct-drive hermetic scroll compressors with centrifugal oil pump and provide positive lubrication to all moving parts. Motor shall be suction gas-cooled and shall have a voltage utilization range of plus or minus 10 percent of nameplate voltage. Crankcase heater, internal temperature and current-sensitive motor overloads shall be included for maximum protection. Scroll compressor shall provide inherently low vibration and noise by having no suction and discharge valves. External high and low pressure cutout devices shall be provided. Evaporator defrost control provided in indoor blower coil shall prevent compressor slugging by temporarily interrupting compressor operation when low evaporator coil temperatures are encountered.

Refrigeration System – Dual Manifolder Compressors

TTA 100C, TTA155C and TTA200F units shall have a single refrigeration circuit with an integral subcooling circuit. A refrigeration filter drier shall be provided as standard. Units shall have both a liquid line and suction gas line service valve with gauge port.

The units shall have two scroll compressors manifolded together. Motor shall be suction gas-cooled and shall have a voltage utilization range of plus or minus 10 percent of nameplate voltage. Crankcase heater, internal temperature and current-sensitive motor overloads shall be included for maximum protection. Scroll type compressor shall provide inherently low vibration and noise by having no suction and discharge valves. External high and low pressure cutout devices shall be

provided. Evaporator defrost control provided in the indoor blower coil shall prevent compressor slugging by temporarily interrupting compressor operation when low evaporator coil temperatures are encountered.

Condenser Coil

Coils shall be internally finned 3/8" copper tubes mechanically bonded to configured aluminum plate fin as standard. Factory pressure and leak tested to 660 psig. Metal grilles with PVC coating for coil protection are optional.

Condenser Fan And Motor(s)

Direct-drive, statically and dynamically balanced 26 or 28 inch propeller fan(s) shall be used in draw-through vertical discharge position. Either permanently lubricated totally enclosed or open construction motors shall be provided and shall have built in current and thermal overload protection. Motor(s) shall be either ball or sleeve bearing type.

Mechanical Specifications

Condensing Units

Controls

Condensing units shall be completely factory wired with necessary controls and contactor pressure lugs or terminal block for power wiring. Unit shall provide an external location for mounting a fused disconnect device.

A choice of microprocessor or electro-mechanical controls shall be available. The 24-volt electro-mechanical control circuit shall include control transformer and contactor pressure lugs for power wiring. Units shall have single point power entry as standard. The microprocessor controls shall provide for all 24-volt control functions. The resident control algorithms shall make all heating, cooling and/or ventilating decisions in response to electronic signals from sensors measuring indoor and outdoor temperatures. The control algorithm maintains accurate temperature control, minimizes drift from set point, and provides better building comfort. A centralized microprocessor shall provide anti-short cycle timing and time delay between compressors to provide a higher level of machine protection.

Time delay timers shall be provided to help prevent compressors in dual compressor units from simultaneous start-up. An anti-short cycle timer shall be available as an optional accessory.

Zone Sensor

This field installed control shall be provided to interface with the Micro equipped units and shall be available in either manual, automatic programmable with night setback, with system malfunction lights, or remote sensor options.

Thermostat

Two stage heating and cooling operation or one stage heating and cooling shall be available for field installation in either manual or automatic changeover. Automatic programmable electronic with night setback shall also be available.

LonTalk® Communication Interface

This factory or field installed option shall be provided to allow the unit to communicate as a Tracer™ LCI-R device or directly with generic LonTalk Network Building Automation System Controls.

Low Ambient Operation

Standard units shall start and operate to approximately 50°F when matched with air handlers and coils. Optional head pressure control accessory permits operation to 0°F.

FACTORY INSTALLED ACCESSORIES

Black Epoxy Coated Condenser Coil —

This option is designed to provide corrosion protection of air cooled condenser coils for seacoast application. The black epoxy coil protection is a factory applied thermoset vinyl coating, bonded to normal aluminum fin stock. The uniform thickness of the bonded vinyl layer exhibits excellent corrosion protection in salt spray tests performed in accordance with ASTM B177.

ACCESSORIES

Low Ambient Head Pressure Control —

Shall control fan motor in response to outdoor ambient temperature and liquid line temperature. Accessory provides unit cooling operation to outdoor temperatures of 0F.

Vibration Isolation Packages — Shall reduce transmission of noise and vibration to building structures, equipment and adjacent spaces. Packages shall be available in either neoprene-in-shear or spring-flex types.

Hot Gas Bypass Kit — Shall be available to provide capacity modulation.

Time Delay Relay — Shall prevent compressors in dual compressor unit from coming on line simultaneously. Timer shall be 24-volt, cycle, with four minute timing period.

Anti-Short-Cycle Timer — Shall prevent rapid on-off compressor cycling in light load conditions by not allowing compressor to operate for 5-7 minutes upon shutdown. Shall consist of a solid state timing device, 24-volt, cycle with either 5 or 7 minute fixed-off timing period.

Condenser Coil Guard — Metal grille with PVC coating shall be provided to alleviate coil damage.

Mechanical Specifications

Air Handlers

General

Air handler units shall be completely factory assembled including coil, condensate drain pan, fan motor(s), filters, and controls in an insulated casing that can be applied in either vertical or horizontal configuration. Units shall be rated and tested in accordance with ARI standard 210/240, 340/360.

Casing

Unit casing shall be constructed of zinc coated, heavy gauge, galvanized steel. Exterior surfaces shall be cleaned, phosphatized, and finished with a weather-resistant baked enamel finish. Casing shall be completely insulated with cleanable, foil faced, fire-retardant, permanent, odorless glass fiber material. All insulation edges shall be either captured or sealed. Knockouts shall be provided for unit electrical power and refrigerant piping connections. Captive screws shall be standard on all access panels.

Refrigeration System

The TWE050A, TWE075A, TWE100A units shall have a single refrigeration circuit and the TWE050B, TWE075B, TWE100B, TWE155B, TWE200B units shall have dual refrigeration circuits. Each refrigeration circuit is controlled by a factory installed thermal expansion valve.

Evaporator Coil

Configured aluminum fin surface shall be mechanically bonded to $\frac{3}{8}$ " (10 mm) internally enhanced copper tubing and factory pressure and leak tested at 450 psig (3103 kPa). Coil is arranged for draw-thru airflow and shall provide a double sloped condensate drain pan constructed of PVC plastic. The drain pan shall be removable for cleaning. The condensate drain pan can be installed in any of four positions allowing for vertical or horizontal application and providing external connections on either side of the unit.

Evaporator Fan

Double inlet, double width, forward curved, centrifugal-type fan(s) with adjustable belt drive shall be standard. Thermal overload protection shall be standard on motor. Fan and motor bearings shall be permanently lubricated. Oversized motors shall be available as an option for high static application.

Controls

Magnetic evaporator fan contactor, low voltage terminal strip, check valve(s), and single point power entry shall be included. All necessary controls shall be factory-installed and wired. Evaporator defrost control shall be included to prevent compressor slugging by temporarily interrupting compressor operation when low evaporator coil temperatures are encountered.

Filters

One inch, throwaway filters shall be standard on TWE050A, TWE075A, TWE100A and TWE100B model air handlers. Filters shall be accessible from the side coil access panel. Filter rack can be field converted to two-inch capability. Two-inch throwaway filters shall be standard on TWE155B, TWE200B and TWE200E models.

Accessories

Electric Heaters — Approved electric heat modules shall be available for installation directly on fan discharge. Electric heaters shall be available in a wide range of capacities with one or two-stage control, single-point electric power connection and terminal strip connections. Electric heater elements shall be constructed on heavy-duty nickel chromium elements internally wye connected on 480/600 volt, three phase and delta connected on 208/240 volt, three phase. Each 208/240 volt,

three phase heater shall have pilot duty with secondary backup fuse links for automatic reset of high limit controls. Each 480/600 volt heater shall have automatic line break high limit controls.

Discharge Plenums and Grilles

Accessory discharge plenums shall be available for vertical, free discharge applications. Plenums shall be constructed of heavy-gauge, zinc coated, galvanized steel finished with baked enamel to match the air handler unit. Grilles shall be satin finished aluminum and have four-way adjustable louvers.

Return Air Grilles — Accessory return air grille shall be provided for vertical front, free return applications. Grilles shall be installed in place of the front lower side panel. Grille shall be satin finished aluminum with non-adjustable louvers.

Mounting Subbase — This accessory shall be available for vertical floor mount configurations. Subbase shall be constructed of heavy gauge, zinc coated, galvanized steel with baked enamel finish to match air handler unit. Subbase is required in the vertical air flow application for condensate drain trapping and when isolators are required.

Vibration Isolators — This accessory shall reduce transmission of noise and vibration to building structures, equipment, and adjacent spaces. Packages shall be available in either neoprene-in shear or spring-flex types in floor or suspended mountings.

Oversized Motors — Field installed oversized motors shall be available for high static pressure applications.

Control Options

Standard Indoor Thermostats — Two stage heating and cooling operation or one stage heating and cooling thermostats shall be available in either manual or automatic changeover.

Programmable Electronic Night Setback Thermostat — The option shall provide heating setback and cooling setup with 7-day programming capability.
