Technology and Benefits

VIDEO

Improved PowerFocus™ HD CRTs

These high quality CRTs, originally used only in HD projections TVs, are now being incorporated into Toshiba's Analog projection TVs. They utilize Fine Phosphor, High Beam Current, a Large Electrostatic Lens Area, and Dynamic Quadruple Focus to achieve 10% More Brightness and 25% Better Sharpness than Standard CRTs for clear HD images. They also add DFine Hi-Speed VSM for further improved sharpness and contrast.

Dynamic Quadruple Focus

While most CRTs can create a fairly precise, round beam spot in the center of the picture, many create a less precise elliptical beam spot at the edges and corners. Dynamic Quadruple Focus utilizes both horizontal and vertical beam adjustment to ensure that even the edges and corners also have a precise beam spot for a sharp, uniform picture from corner to corner.

DFine™ Hi-Speed VSM

VSM adjusts the CRT scanning speed to create sharp, well defined edges. DFine increases the scanning speed by 80% for even greater detail.

TruView™

A suite of video circuitry that includes Black Level Expansion, Fine White, Flesh Tone Correction, and Color Detail Enhancer. This system ensures true colors and more accurate picture detail, for a more natural and realistic video image.
