REPORTING ERRORS AND RECOMMENDING IMPROVEMENTS

You can help Improve this manual. If you find any mistakes or if you know of a way to improve the procedures, please let us know. Mail your letter, DA Form 2028 (Recommended Changes to Publications and Blank Forms), or DA Form 2028-2 located in back of this manual direct to Commander, US Army Communications and Electronics Materiel Readiness Command, ATTN: DRSEL-ME-MQ, Fort Monmouth, NJ 07703. In either case, a reply will be furnished direct to you.

This manual is an authentication of the manufacturer's commercial literature which, through usage, has been found to cover the data required to operate and maintain this equipment. Since the manual was not prepared in accordance with military specifications, the format has not been structured to consider levels of maintenance.

INTRODUCTION

0-1. SCOPE.

This manual describes Logarithmic Preamplifier AM-6681(V)1/U and provides instructions for operation and maintenance. Throughout this manual, the preamplifier is referred to as Hewlett-Packard Model 8808A Log-Audio Preamplifier.

0-2. INDEXES OF PUBLICATIONS.

- <u>a. DA Pam 310-4</u>. Refer to the latest issue of DA Pam 310-4 to determine whether there are new editions, changes, or additional publications pertaining to the equipment.
- <u>b. DA Pam 310-7</u>. Refer to DA Pam 310-7 to determine whether there are modification work orders (MWO's) pertaining to the equipment.

0-3. MAINTENANCE FORMS, RECORDS, AND REPORTS.

- <u>a. Reports of Maintenance and Unsatisfactory Equipment</u>. Department of the Army forms and procedures used for equipment maintenance will be those prescribed by TM 38-750, The Army Maintenance Management System.
- <u>b. Report of Item and Packaging Discrepancies</u>. Fill out and forward SF 364 (Report of Discrepancy (ROD)) as prescribed in AR 735-11-2/DLAR 4140.55/NAVMATINST 4355.73/AFR 400-54/MCO 4430.3E.
- c. Discrepancy in Shipment Report (DISREP) (SF 361). Fill out and forward Discrepancy in Shipment Report (DISREP) (SF 361) as prescribed in AR 55-38/NAVSUPINST 4610.33B/AFR 75-18/MCO P4610.19C and DLAR 4500.15.

0-4. REPORTING EQUIPMENT IMPROVEMENT RECOMMENDATIONS (EIR).

If your equipment needs improvement, let us know. Send us an EIR. You, the user, are the only one who can tell us what you don't like about your equipment. Let us know why you don't like the design. Tell us why a procedure is hard to perform. Put it on an SF 368 (Quality Deficiency Report). Mail it to Commander, US Army Communications and Electronics Materiel Readiness Command, ATTN: DRSEL-ME-MQ, Fort Monmouth, New Jersey 07703. We'll send you a reply.

0-5. ADMINISTRATIVE STORAGE.

Administrative storage of equipment issued to and used by Army activities shall be in accordance with TM 740-90-1.

0-6. DESTRUCTION OF ARMY ELECTRONICS MATERIEL.

Destruction of Army electronics materiel to prevent enemy use shall be in accordance with TM 750-244-2.

SECTION I GENERAL INFORMATION

1-1. DESCRIPTION.

- 1-2 The 8808A is a Log Level Preamplifier which produces a dc output proportional to the logarithm of the ac input signal, over an extremely wide range of signal amplitudes. The input signal dynamic range can be up to 100 dB (100,000:1). In addition, a 50 dB (320:1) span is provided for greater signal resolution
- 1-3. The Preamplifier is designed for use with low output impedance accelerometers, as well as vibration and acoustic transducers, which have outputs in the frequency range of 5 Hz to 100 kHz. It is also useful for continuous monitoring or recording of signal output in dB during frequency analysis of amplifiers, filters, transmission networks, and similar devices.
- 1-4. The 8808A can be plugged into Sanborn direct writing recording systems. When used with recorders having 50 division chart paper, the calibrated output is 2 dB per division for the 100 dB span, or 1 dB per division for the 50 dB span. Also, the preamplifier can be benchtop or rack mounted, with the output connected to a monitoring instrument such as a voltmeter or oscilloscope. For recording, a strip chart recorder or magnetic tape recorder can be connected to the output.
- 1-5. The range switch provides nine bottom scale sensitivities in 10 dB steps from 0 dBV to -80 dBV (dBV = decibels referred to 1 volt RMS). For the 50 dB span, the full scale signal is 50 dB above the bottom scale level. For the 100 dB span, the full scale signal is 100 dB above the bottom scale level.
- 1-6. All nine RANGE switch positions can be used with the 50 dB span. The four switch positions outlined in red on the panel (-50, -60, -70, -80) are used for the 100 dB span only.
- 1-7. Specifications for the 8808A Log Level Preamplifier are given in Table 1-1.

Figure 1-1. 8808A Log Level Preamplifier

ELECTRICAL SPECIFICATIONS

INPUT RESISTANCE: Single-ended to ground 1 megohm minimum.

SIGNAL DETECTION: Full-wave average. 50 dB or 100 dB span, switch selected from front panel.

DETECTION ACCURACY: ± 1 dB maximum error, sine wave input.

MAXIMUM SENSITIVITY: 100 µV rms of sine wave corresponds to bottom scale on most sensitive range.

GAIN STABILITY: Temperature: Less than 2 dB/10°C, 0° to 40°C. Line Voltage: Less than 0.5 dB, 103 to 127 volts.

ATTENUATION: 50 dB span ranges: 9 bottom scale ranges at -80 dBV to 0 dBV in 10 dB steps corresponding to 100 μ V, 320 μ V, 1 mV, 3.2 mV, 10 mV, 32 mV, 100 mV, 320 mV and 1 volt. Top scale is nominally 50 dB (320X) above bottom scale.

100 dB span ranges: 4 bottom scale ranges at -80 dBV to -50 dBV in 10 dB steps corresponding to 100 μ V, 320 μ V, 1 mV and 3.2 mV. Top scale is normally 100 dB (100,000X) above bottom scale.

ATTENUATION ACCURACY: \pm 3% maximum error (0.25 dB) for -80 to -50 dBV attenuation ranges. For other ranges, detection error (\pm 1 dB) may add to attenuation error.

OUTPUT: Single-ended to ground, ± 2..5 V maximum or 0 to +5 volts across 1000 ohms minimum.

OUTPUT RESISTANCE: Approximately 10 ohms.

SIGNAL BANDWIDTH: 5 Hz to 100 kHz, less than 3 dB down from mid-band level on SLOW response range. 500 Hz to 100 kHz on FAST response range.

SIGNAL CREST FACTOR: 3 to 1 at full scale on 100 dB span, ±500 volts peak maximum allowed.

DETECTION RESPONSE TIME: For a step change in input amplitude with ratio of 40 dB (100:1) or greater, the time required for the output to increase or decrease between values corresponding to 105 and 90% of the maximum applied signal (i.e., 20 dB below max. applied signal and 1 dB below max applied signal) is approximately 20 msec in FAST position and 2 sec in SLOW position. i. e., average rate of change of output under these conditions corresponds to approximately 900 dB/ sec in FAST: 9 dB/sec in SLOW.

OUTPUT NOISE: Maximum noise appears at bottom scale. 50 dB span: 80 mV pp: 100 dB span: 40 mV pp.

INTERNAL CALIBRATION: -80 and +20 dBV, internally adjustable; -30 dBV accurate to + 0.5 dB. Stability: less than 0.25 dB, 10° to 40°C or 103 to 127 volts; approximately 500 Hz.

GENERAL SPECIFICATIONS

Terminals: DC output on front panel. Input and auxiliary DC output on rear of mating power supply.

Front Panel Controls: RANGE switch; GAIN potentiometer locking; LOG ZERO, 10-turn potentiometer, locking; 50/100 dB SPAN switch; SPAN BALANCE, screwdriver adjust; RESPONSE TIME/CAL switch.

Internal Controls: Signal Board: Balance adjust; CAL adjust (2); Zero Suppression adjust; Attenuator compensation trimmers (4). Detector Board: 100 dB span mid-scale adjust.

Weight: Approximately 5 lb. (2, 3 kg).

Front Panel Dimensions: 7" high, 2-1/16" wide (178 x 52 mm).

Note: When Preamplifier is used in a recording system, these specifications are affected by performance of the recorder and driver amplifiers. (Consult data sheet of appropriate system for details.)

All Sanborn 8800 Series Amplifiers are tested for performance under normal production environmental conditions: ambient temperature 20° to 30° C and relative humidity less than 80% unless otherwise noted.

SECTION II INSTALLATION

- 2-1. PORTABLE CASE OR RACK MOUNTING.
- 2-2. The 8808A is operated as a self-contained instrument using an 860-500 Power Supply to furnish operating power for the preamplifier. The preamplifier power supply combination operates on a 115/230 volt 50 or 60 Hz power line. See the power supply Operating and Service Manual, IM-860-500-3.
- 2-3. The preamplifier power supply combination can be mounted in the 860-1400 Case for single channel benchtop operation. For two channel operation, two preamplifiers and power supplies mount in an 860-200 Module, for benchtop or rack mounting.
- 2-4. When the 8808A is operated with the 860-500 Power Supply, preamplifier input and output signal connections are made on the rear panel of the power supply as follows:

Signal Input Jack J3: Plus (+) signal pin A

Signal ground pin B

Mating connector is 10G3-34FW

Signal Output Jack J2: Plus (+) signal pin A

Signal ground pin E

Mating connector is 10B9-5MW

For monitoring, connect the preamplifier output signal to a voltmeter, oscilloscope, or other voltage indicating instrument which has a signal range of 0 to \pm 5 volts or 2.5 volts. The output signal can be recorded using a strip chart recorder, magnetic tape recorder, or other instrument which will operate with an input of 0 to \pm 5 volts, or \pm 2.5 volts.

- 2-5. INSTALLATION IN SANBORN RECORDING SYSTEMS.
- 2-6. The 8808A can be installed in Sanborn Recording Systems 7701A, 7702A, 7704A, 7706A, 7708A, for 1, 2, 4, 6, or 8 channels of recording using the heated stylus recording technique. Operating power for the preamplifier is supplied by the recording system. See the recording system instruction manual for installation information.
- 2-7. The 7701A Recorder is supplied in a portable case. The 7702A Recorder is supplied either in a mobile cart, or for rack mounting. The 7706A, 7708A Recorders are rack mounted.

SECTION III OPERATION

3-1. OPERATING CONTROLS.

- 3-2. RANGE switch selects the bottom scale signal level. Scale is calibrated in dBV (decibels referred to a 1 volt rrns signal). Full scale signal for 50 Db span operation is 50 dB above bottom scale signal. For 100 dB span, full scale signal is 100 dB above bottom scale signal. Bottom scale and corresponding full scale signal levels for each setting of the RANGE switch are given in Table 3-1.
- 3-3. DB SPAN switch selects either 50 dB or 100 dB maximum span between the bottom scale and full scale input signal levels.

NOTE

On the 100 dB span, only the - 50, -60, -70, -80 RANGE switch positions are used.

Switch also indicates recorder calibration: 1 dB/div for 50 dB span. 2 dB/div for 100 dB span.

50 DB SPA Range	AN			
Switch	Bot	tom Scale	<u>Full</u> :	<u>Scale</u>
<u>Setting</u>	<u>dBV</u>	Volts rms	<u>dBV</u>	Volts rms
0	0	1 V	+50	316 V
-10	-10	.316V	+40	100 V
-20	-20	.100V	+30	31.6 V
-30	-30	31.6 mnV	+20	10 V
-40	-40	10 mV	+10	3.16 V
-50	-50	3.16 mV	0	1 V
-60	-60	1 mV	-10	.316 V
-70	-70	316 μV	-20	.1 V
-80	-80	100 μV	-30	31.6 mV
100 DB SF	PAN			
-50	-50	3.16 mV	+50	316 V
-60	-60	1 mV	+40	100 V
-70	-70	316 μV	+30	31.6 V
-80	-80	100 μV	+20	10 V
		·		

Table 3-1. Bottom and Full Scale Signal Levels

- 3-4. GAIN control sets the preamplifier output level for a full scale cal signal applied to the preamplifier input. For use in recording systems, full scale output corresponds to the top division on the recorder chart (approx. -2.5 volts preamp output). For use with a voltmeter or oscilloscope, full scale output is +5 volts.
- 3-5. LOG ZERO control sets the preamplifier output level for a bottom scale cal signal applied to the preamplifier input. For use in recording systems, bottom scale output-corresponds to the bottom division on the recording chart (approx. -2.5 volts preamp output). For use with a voltmeter or oscilloscope, bottom scale output is 0 volts.
- 3-6. SPAN BALANCE control balances the preamplifier, to obtain the same output on the 100 and 50 dB spans for a -80 dBV calibration signal level.
- 3-7. RESP TIME,/CAL DB switch selects the operating mode. FAST and SLOW response times are the use positions. OFF position disconnects the input signal from the preamplifier, and grounds the preamplifier input. -80, -30, +20 dB CAL positions select calibration voltage levels supplied by a 500 Hz oscillator in the preamp.
- 3-8. OUTPUT jack provides the preamplifier output signal at the front panel, for monitoring purposes. Mates with 10G2-22MW plug.

3-9. BALANCING

- 3-10. Allow preamplifier to warm up several minutes before balancing.
 - a. Set the RESP TIME/CAL DB and RANGE switches to the -80 position.
 - b. Adjust the LOG ZERO control for approximately bottom scale output.
- c. Alternately set the DB SPAN switch to the 50 and 100 positions while adjusting the SPAN BALANCE control for minimum change in the preamp output.

NOTE

Approximately ± 20 mnV noise normally present at the preamplifier output will cause a slight fluctuation in the reading observed on a voltmeter or oscilloscope connected to the output.

3-11. CALIBRATION

- a. Set the DB SPAN switch to 100.
- b. Set the RANGE switch to 80.
- c. Set the RESP TIME/CAL DB switch to -80.
- d. Adjust the LOG ZERO control for bottom scale output.
- e. Set the RESP TIME/CAL DB switch to +20 and adjust the GAIN control for full scale output.
- f. Repeat steps 3-11 (c) through 3-11 (e) to eliminate the effects of control interaction.
- g. Set the RESP TIME/CAL DB switch to OFF. With the switch OFF, a negative voltage is normally present at the preamp output, which will position the recorder stylus offscale.

NOTE

Preamp RANGE switch must be in the -80 position during the calibration procedure.

3-12. ALTERNATE CALIBRATION PROCEDURE.

- 3-13. To calibrate the preamplifier with the DB SPAN switch in the 50 dB position, use the below procedure:
 - a. Set the DB SPAN switch to 50.
 - b. Set the RANGE switch to -80.
 - c. Set the RESP TIME/CAL DB switch to -80.
 - d. Adjust the LOG ZERO control for bottom scale output.
 - e. Set the RESP TIME/CAL DB switch to -30 and adjust the GAIN control for full scale output.
 - f. Repeat steps 3-13 (c, d, e) to eliminate the effects of control interaction.
- g. Set the RESP TIME/CAL DB switch to OFF. With the switch OFF, a negative voltage is normally present at the preamp output, which will position the recorder stylus offscale.

3-14. OPERATION

- 3-15. Set RESP TIME/CAL DB switch to OFF. Connect input signal to preamplifier. For applications where preamplifier is installed in Sanborn recorder, the output signal is displayed on recorder chart paper. For applications where the preamplifier output is to be monitored with an oscilloscope or voltmeter, the output is available from the preamplifier front panel OUTPUT jack, or from a rear connector on the preamplifier power supply.
- 3-16. Set the DB SPAN switch to the 50 dB or 100 dB position, depending on the expected range of input signal amplitudes.

3-17. 50 dB SPAN OPERATION.

3-18. Set the RANGE switch to the position which corresponds to the minimum expected signal level. See examples 1 and 2.

EXAMPLE 1: Minimum expected signal level 10 mnV rms. This corresponds to a -40 dBV signal level (see Table 3-1). Set the RANGE switch to the -40 dBV position. The full scale signal level is 50 dB higher:

-40 dBV add +50 dB +10 dBV = Full scale input signal = 3.16 volts rms

<u>EXAMPLE 2:</u> Minimum expected signal level .5 volt rms. This corresponds to a -6 dBV signal level. Since there is no -6 dBV switch position, set the switch to the next lower step, which is -10 dBV. The full scale signal level is 50 dB higher:

-10 dBV add +50 dB -40 dBV Full scale input signal = 100 volts rms

- 3-19. Set the RESP TIME/CAL DB switch to the FAST or SLOW position, depending on the signal bandwidth, and the detection response) time desired. (For FAST response, the preamp) bandwidth is 500 to 100,000 Hz. For SLOW response, bandwidth is 5 to 100,000 Hz.)
- 3-20. For 50 division chart paper, the calibration is 1 dB/div. The bottom division on the chart represents the bottom scale signal level in dB indicated on the RANGE switch.
- 3-21. 100 dB SPAN OPERATION.
- 3-22. Only the four RANGE switch positions outlined in red (-80, -70, -60, -50) are used for the 100 dB span. Set the RANGE switch to the position which corresponds to the expected minimum signal level.

<u>EXAMPLE 1</u>: Minimum expected signal is 1 mV rms. This corresponds to a -60 dBV level (see Table 3-1). Set RANGE switch to the - 6OdBV bottom scale position. The full scale signal level is I00dB higher:

- 60 dBV add +100 dB + 40 dBV = Full scale input signal = 100 volts rms

EXAMPLE 2: Minimum expected signal is

 $500 \,\mu\text{V}$ rms. This corresponds to a -66 dBV level. Set the RANGE switch to the next lower step, which is the -70 dBV bottom scale position. The full scale signal level is 100 dB higher:

- 70 dBV add +100 dB + 30 dBV = Full scale input signal = 31.6 volts rms

- 3-23. Set the RESP TIME/CAL DB switch to the FAST or SLOW position, depending on the signal blind bandwidth, and the detection response time desired. (For FAST response, the preamp bandwidth is 500 to 100,000 Hz. For SLOW response, bandwidth is 5 to 100,000 Hz.)
- 3-24. For 50 division chart paper, the calibration is 2 dB/div. The bottom division on the chart represents the bottom scale signal level in dBV indicated on the RANGE switch.
- 3-25. OPERATION WITH MONITORING INSTRUMENTS.
- 3-26. When the preamplifier output is connected only to a monitoring instrument such as a dc voltmeter or oscilloscope, perform the balancing (Section 3-9) and calibration (Section 3-11) procedure as indicated. Bottom scale output refers to 0 volts preamplifier output. Full scale output is -5 volts preamplifier output. The 50 dB span calibration is .1 volts/dB. The 100 dB span calibration is .05 volts/dB.
- 3-27. SIMULTANEOUS RECORDING AND MONITORING OF 8808A OUTPUT.
- 3-28. To simultaneously record and monitor the 8808A output signal, perform the balancing and calibration procedure using the recorder. The dc voltmeter, oscilloscope, or other monitoring instrument connected to the output of the preamp will read approximately -2.5 volts for a bottom scale input signal, and approximately +2.5 volts for a full scale input signal. The monitor instrument calibration is .1 V/dB on the 50 dB span, and .05 V/dB on the 100 dB span.

SECTION IV PRINCIPLES OF OPERATION

- 4-1. The 8808A Log Level Preamplifier is designed to produce a logarithmic output (in decibel units) on a linear scale for a wide dynamic range (100 dB) of input signals. The wide dynamic range is achieved by the use of a combination of series and shunt successive detector stages. The block diagram (Figure 4-1) shows a simple series of successive detector stages with logarithmic compression networks, similar to those used in the 8808A.
- 4-2. Each stage consists of a linear amplifier having a gain of 16-2/3 dB. Limiting diodes at the input of each stage prevent amplifier saturation. The full-wave detector output drives a logarithmic response shaping network. The outputs of all stages are connected to a summing resistor. This series of stages handles the first 50 dB of amplifier signal input. For 100 dB span operation, a second series of successive detectors covers the remaining 50 dB of signal range.
- 4-3. Signal flow as shown in Figure 4-1 is as follows: A small ac signal appearing at the input is amplified by stage 3, but not sufficiently to provide detector output. The signal is further amplified by stage 2, but is still not sufficient amplitude to detect. The signal is amplified by stage 1 to a level sufficient to operate the first detector. The output of the fullwave detector is compressed by a three-line segment logarithmic compression network. All compression network outputs are connected to the summing resistor. As the input level increases, successive compression in stages 2 and 3 perform a similar function, feeding their output to the summing junction.
- 4-4. The very wide dynamic range of the 8808A is made possible by the progressive summing of the outputs of each of the detector stages, which by themselves operate linearly over a 16-2/3dB range.
- 4-5. The overall block diagram for the 8808A is shown in Figure 4-2. A signal at the input sees the input Attenuator which is followed by a differential, low noise operational amplifier using field effect transistors. The amplifier output is connected to a series of detector and compressor networks to provide the first 50 dB of operating range. A shunt signal path with a hybrid emitter follower drives the lower series of detector networks for the remaining, 50 dB of signal level.
- 4-6. The detector outputs are summed into a balanced dc amplifier. The SPAN BALANCE, control and zero suppression circuit outputs are also summed into the balanced amplifier. The action of the SPAN BALANCE control is to produce the same bottom scale output from the dc amplifier on the 50 dB and 100 dB spans. The zero suppression circuit works in conjunction with the input Attenuator.
- 4-7. The DB SPAN switch circuit is located in the feedback loop of the balanced dc amplifier to produce a 2:1 gain change in the amplifier output, depending on the setting of the SPAN switch.
- 4-8. The output of the balanced amplifier is fed to a shunt gain control, followed by the output differential to single-ended dc amp which has a dc signal summed in from the LOG ZERO control to set log zero level.

ELECTRICAL SAFETY

The electrical safety of this product has been considered in its design and production, and its construction has employed techniques and components in accordance with the National Electrical Code and Underwriters Laboratories, Inc. These safety features apply only if the product is connected to a primary power distribution system which provides adequate grounding and is installed and maintained in accordance with the National Electrical Code. When this product is interconnected with other electrical appliances in its normal operation, it is important that these other appliances also be provided with adequate grounding protection, where required, if they are, in turn, connected to a primary power source. Faults occurring in any interconnected appliance can degrade the safety of this product by means of the electrical interconnections necessary for its normal systems operation. Recommendations indicating some of the accessory appliances which may be used with this product are given elsewhere in this publication.

Figure 4-2. 8808A Block Diagram

SECTION V REPLACEABLE PARTS

5-1. INTRODUCTION.

- 5-2. This section contains information for locating and ordering replacement parts. Table 5-1 provides the following information for each item.
 - a. Lists electrical parts in alpha-numeric order of their reference designators.
 - b. The Sanborn stock number.
 - c. The part description.
 - d. Lists miscellaneous parts in numerical order

5-3. ORDERING INFORMATION.

- 5-4. To order a replacement part, note the part number and then cross reference that part number to the National Stock Number in table 5-2; then order through normal ordering channels. If the part number does not have a National Stock Number, then order the part through normal ordering channels using the commercial part number. Specify the following information for each part:
 - a. Model and s/n of the instrument.
 - b. Sanborn stock number.
 - c. Circuit reference designator.
 - d. Description.
- 5-5. To order a part not listed in the tables, give a complete description of the part and include its function and location.

APPENDIX D

MAINTENANCE ALLOCATION

Section I. INTRODUCTION

D-1. General

This appendix provides a summary of the maintenance operations for the AM-6681 (V)/U. It authorizes categories of maintenance for specific maintenance functions on repairable items and components and the tools and equipment required to perform each function. This appendix may be used as an aid in planning maintenance operations.

D-2. Maintenance Function

Maintenance functions will be limited to and defined as follows:

- a. *Inspect.* To determine the serviceability of an item by comparing its physical, mechanical, and/or electrical characteristics with established standards through examination.
- b. Test. To verify serviceability and to detect incipient failure by measuring the mechanical or electrical characteristics of an item and comparing those characteristics with prescribed standards.
- c. Service. Operations required periodically to keep an item in proper operating conditions, i.e., to clean (decontaminate), to preserve, to drain, to paint, or to replenish fuel, lubricants, hydraulic fluids, or compressed air supplies.
- d. Adjust To maintain, within prescribed limits, by bringing into proper or exact position, or by setting the operating characteristics to the specified parameters.
- e. Align. To adjust specified variable elements of an item to bring about optimum or desired performance.
- f. Calibrate. To determine and cause corrections to be made or to be adjusted on instruments or test measuring and diagnostic equipments used in precision measurement. Consists of comparisons of two instruments, one of which is a certified standard of known accuracy, to detect and adjust any discrepancy in the accuracy of the instrument being compared.
- g. Install. The act of emplacing, seating, or fixing into position an item, part, module (component or assembly) in a manner to allow the proper functioning of the equipment or system.
- h. Replace. The act of substituting a serviceable like type part, subassembly, or module (component or assembly) for an unserviceable counterpart.
- *i.* Repair. The application of maintenance services (inspect, test, service, adjust, align, calibrate, replace) or other maintenance actions (welding, grinding, riveting, straightening, facing, remachining, or resurfacing) to restore serviceability to an item by correcting specific damage, fault, malfunction, or failure in a part, subassembly, module (component or assembly), end item, or system.
- *j. Overhaul.* That maintenance effort (service/action) necessary to restore an item to a completely serviceable/operational condition as prescribed by maintenance standards (i.e., DMWR) in appropriate technical publications. Overhaul is normally the highest degree of maintenance performed by the Army. Overhaul does not normally return an item to like new condition.
- *k. Rebuild.* Consists of those services actions necessary for the restoration of unserviceable equipment to a like new condition in accordance with original manufacturing standards. Rebuild is the highest degree of materiel maintenance applied to Army equipment. The rebuild operation includes the act of returning to zero those age measurements (hours, miles, etc.) considered in classifying Army equipments/components.

D-3. Column Entries

- a. Column 1, Group Number. Column 1 lists group numbers, the purpose of which is to identify components, assemblies, subassemblies, and modules with the next higher assembly.
- b. Column 2, Component/Assembly. Column 2 contains the noun names of components, assemblies, subassemblies, and modules for which maintenance is authorized.
- c. Column 3, Maintenance Functions. Column 3 lists the functions to be performed on the item listed in column 2. When items are listed without maintenance functions, it is solely for purpose of having the group numbers in the MAC and RPSTL coincide.
- d. Column 4, Maintenance Category. Column 4 specifies, by the listing of a "worktime" figure in the appropriate subcolumn(s), the lowest level of maintenance authorized to perform the function listed in column 3. This figure represents the active time required to perform that maintenance function at the indicated category of maintenance. If the number or complexity of the tasks within the listed maintenance function vary at different maintenance categories, appropriate "worktime" figures will be shown for each category. The number of task-hours specified by the "worktime" figure represents the average time required to restore an item (assembly, subassembly, component, module, end item or system) to a serviceable condition under typical field operating conditions. This time includes preparation time, troubleshooting time, and quality assurance/quality control time in addition to the time required to perform the specific tasks identified for the maintenance functions authorized in the maintenance allocation chart. Subcolumns of column 4 are as follows:
- C Operator/Crew
- O Organizational
- F Direct Support
- H General Support
- D Depot
- e. Column 5, Tools and Equipment. Column 5 specifies by code, those common tool sets (not individual tools) and special tools, test, ,and support equipment required to perform the designated function.
- f. Column 6, Remarks. Column 6 contains an alphabetic code which leads to the remark in section IV, Remarks, which is pertinent to the item opposite the particular code.
- D-4. Tool and Test Equipment Requirement (sect III)
- a. Tool or Test Equipment Reference Code. The numbers in this column coincide with the numbers used in the tools and equipment column of the MAC. The numbers indicate the applicable tool or test equipment for the maintenance functions.
- b. Maintenance Category. The codes in this column indicate the maintenance category allocated the tool or test equipment.
- c. Nomenclature. This column lists the noun name and nomenclature of the tools and test equipment required to perform the maintenance functions.
- d. National/NATO Stock Number. This column lists the National/NATO stock number of the specified tool or test equipment.
- e. Tool Number. This column lists the manufacturer's part number of the tool followed by the Federal Supply Code for manufacturers (5-digit) in parentheses.
- D-5. Remarks (sect IV)

Not applicable.

K4XL's BAMA

This manual is provided FREE OF CHARGE from the "BoatAnchor Manual Archive" as a service to the Boatanchor community.

It was uploaded by someone who wanted to help you repair and maintain your equipment.

If you paid anyone other than BAMA for this manual, you paid someone who is making a profit from the free labor of others without asking their permission.

You may pass on copies of this manual to anyone who needs it. But do it without charge.

Thousands of files are available without charge from BAMA. Visit us at http://bama.sbc.edu
