

Features

- **Powerful Harvard Architecture Processor**
 - M8C Processor Speeds to 24 MHz
 - Two 8x8 Multiply, 32-bit Accumulate
 - 3.0V to 5.25V Operating Voltage
 - USB 2.0 USB-IF certified. TID# 40000110
 - Operating Temperature Range: 0°C to +70°C
- **Advanced Peripherals (enCoRe™ III Blocks)**
 - 6 Analog enCoRe III Blocks provide:
 - Up to 14-bit Incremental and Delta-Sigma ADCs
 - Programmable Threshold Comparator
 - 4 Digital enCoRe III Blocks provide:
 - 8-bit and 16-bit PWMs, timers and counters
 - I²C Master
 - SPI Master or Slave
 - Full Duplex UART
 - CYFISNP and CYFISPI modules to talk to Cypress CYFI radio
- **Complex Peripherals by Combining Blocks**
- **Full-Speed USB (12 Mbps)**
 - Four Unidirectional Endpoints
 - One Bidirectional Control Endpoint
 - Dedicated 256 Byte Buffer
 - No External Crystal Required
 - Operational at 3.0V – 3.6V or 4.35V – 5.25V
- **Flexible On-Chip Memory**
 - 16K Flash Program Storage 50,000 Erase/Write Cycles
 - 1K SRAM Data Storage
 - In-System Serial Programming (ISSP)
 - Partial Flash Updates
 - Flexible Protection Modes
 - EEPROM Emulation in Flash
- **Programmable Pin Configurations**
 - 25-mA Sink on all GPIO
 - Pull up, Pull down, High-Z, Strong, or Open Drain Drive Modes on all GPIO
 - Configurable Interrupt on all GPIO
- **Precision, Programmable Clocking**
 - Internal ±4% 24 and 48 MHz Oscillator
 - Internal Oscillator for Watchdog and Sleep
 - 0.25% Accuracy for USB with no External Components

- **Additional System Resources**
 - I²C™ Slave, Master, and Multi-Master to 400 kHz
 - Watchdog and Sleep Timers
 - User-Configurable Low Voltage Detection
 - Integrated Supervisory Circuit
 - On-Chip Precision Voltage Reference
- **Complete Development Tools**
 - Free Development Software (PSoc® Designer™)
 - Full-Featured, In-Circuit Emulator and Programmer
 - Full Speed Emulation
 - Complex Breakpoint Structure
 - 128K Bytes Trace Memory

enCoRe III Functional Overview

The enCoRe III is based on flexible PSoC architecture and is a full-featured, full-speed (12 Mbps) USB part. Configurable analog, digital, and interconnect circuitry enable a high level of integration in a host of consumer, and communication applications.

This architecture allows the user to create customized peripheral configurations that match the requirements of each individual application. Additionally, a fast CPU, Flash program memory, SRAM data memory, and configurable IO are included in both 28-pin SSOP and 56-pin QFN packages.

The enCoRe III architecture, as illustrated in Figure 1, is comprised of four main areas: enCoRe III Core, Digital System, Analog System, and System Resources including a full-speed USB port. Configurable global busing allows all the device resources to combine into a complete custom system. The enCoRe III CY7C64215 can have up to seven IO ports that connect to the global digital and analog interconnects, providing access to 4 digital blocks and 6 analog blocks.

enCoRe III Core

The enCoRe III Core is a powerful engine that supports a rich feature set. The core includes a CPU, memory, clocks, and configurable GPIO (General Purpose IO).

The M8C CPU core is a powerful processor with speeds up to 24 MHz, providing a four MIPS 8-bit Harvard architecture microprocessor. The CPU utilizes an interrupt controller with up to 20 vectors, to simplify programming of real-time embedded events. Program execution is timed and protected using the included Sleep and Watch Dog Timers (WDT).

Memory encompasses 16K of Flash for program storage, 1K of SRAM for data storage, and up to 2K of EEPROM emulated using the Flash. Program Flash utilizes four protection levels on blocks of 64 bytes, allowing customized software IP protection.

enCoRe III incorporates flexible internal clock generators, including a 24 MHz IMO (internal main oscillator) accurate to 8% over temperature and voltage. The 24 MHz IMO is doubled to 48 MHz for use by the digital system, if needed. The 48 MHz clock is required to clock the USB block and must be enabled for USB

communication. A low power 32 kHz ILO (internal low speed oscillator) is provided for the Sleep timer and WDT. The clocks, together with programmable clock dividers (as a System Resource), provide the flexibility to integrate almost any timing requirement into the enCoRe III. In USB systems, the IMO self-tunes to $\pm 0.25\%$ accuracy for USB communication.

enCoRe III GPIOs provide connection to the CPU, digital and analog resources of the device. Each pin's drive mode may be selected from eight options, allowing great flexibility in external interfacing. Every pin also has the capability to generate a system interrupt on high level, low level, and change from last read.

The Digital System

The Digital System is composed of four digital enCoRe III blocks. Each block is an 8-bit resource that is used alone or combined with other blocks to form 8, 16, 24, and 32-bit peripherals, which are called user module references.

Figure 1. Digital System Block Diagram

Digital configurations that can be built from the blocks include those listed below.

- PWMs, Timers and Counters (8-bit and 16-bit)
- UART 8-bit with selectable parity
- SPI master and slave
- I²C Master
- RF Interface: Interface to Cypress CYFI Radio

The digital blocks is connected to any GPIO through a series of global buses that can route any signal to any pin. The buses also allow for signal multiplexing and for performing logic operations. This configurability frees your designs from the constraints of a fixed peripheral controller.

The Analog System

The Analog System is composed of six configurable blocks, comprised of an opamp circuit allowing the creation of complex analog signal flows. Analog peripherals are very flexible and are customized to support specific application requirements. enCoRe III analog function supports the Analog-to-digital converters (with 6 to 14-bit resolution, selectable as Incremental, and Delta Sigma) and programmable threshold comparator).

Analog blocks are arranged in two columns of three, with each column comprising one CT (Continuous Time - AC B00 or AC B01) and two SC (Switched Capacitor - ASC10 and ASD20 or ASD11 and ASC21) blocks, as shown in Figure 2.

Figure 2. Analog System Block Diagram

The Analog Multiplexer System

The Analog Mux Bus can connect to every GPIO pin in ports 0–5. Pins which are connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with comparators and analog-to-digital converters. It is split into two sections for simultaneous dual-channel processing. An additional 8:1 analog input multiplexer provides a second path to bring Port 0 pins to the analog array.

Additional System Resources

System Resources provide additional capability useful to complete systems. Additional resources include a multiplier, decimator, low voltage detection, and power-on reset. Brief statements describing the merits of each resource follow.

- Full-Speed USB (12 Mbps) with five configurable endpoints and 256 bytes of RAM. No external components required except two series resistors.
- Two multiply accumulates (MACs) provide fast 8-bit multipliers with 32-bit accumulate, to assist in both general math and digital filters.
- The decimator provides a custom hardware filter for digital signal processing applications including the creation of Delta Sigma ADCs.
- Digital clock dividers provide three customizable clock frequencies for use in applications. The clocks are routed to both the digital and analog systems.
- The I2C module provides 100 and 400 kHz communication over two wires. Slave, master, and multi-master modes are all supported.
- Low Voltage Detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.

enCoRe III Device Characteristics

enCoRe III devices have four digital blocks and six analog blocks. The following table lists the resources available for specific enCoRe III device.

Getting Started

The quickest path to understanding enCoRe III silicon is by reading this data sheet and using the PSoC Designer Integrated Development Environment (IDE). This data sheet is an overview of the enCoRe III integrated circuit and presents specific pin, register, and electrical specifications. enCoRe III is based on the architecture of the CY8C24794. For in-depth information, along

with detailed programming information, reference the *PSoC™ Mixed-Signal Array Technical Reference Manual*.

For up-to-date Ordering, Packaging, and Electrical Specification information, reference the latest enCoRe III device data sheets on the web at <http://www.cypress.com>.

Development Kits

Development Kits are available from the following distributors: Digi-Key, Avnet, Arrow, and Future. The Cypress Online Store contains development kits, C compilers, and all accessories for enCoRe III development. Go to the Cypress Online Store web site at <http://www.cypress.com>, click the Online Store shopping cart icon at the bottom of the web page, and click *USB (Universal Serial Bus)* to view a current list of available items.

Development Tools

PSoC Designer is a Microsoft® Windows® based, integrated development environment for enCoRe III. The PSoC Designer IDE and application runs on Windows NT 4.0, Windows 2000, Windows Millennium (Me), or Windows XP. (Refer to the PSoC Designer Functional Flow diagram below).

PSoC Designer helps the customer to select an operating configuration for the enCoRe III, write application code that uses the enCoRe III, and debug the application. This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and the CYASM macro assembler for the CPUs. PSoC Designer also supports a high-level C language compiler developed specifically for the devices in the family.

Figure 3. PSoC Designer Subsystems

PSoC Designer Software Subsystems

Device Editor

The Device Editor subsystem allows the user to select different onboard analog and digital components called user modules using the enCoRe III blocks. Examples of user modules are ADCs, SPIM, UART, and PWMs.

The device editor also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic configuration allows for changing configurations at run time.

PSoC Designer sets up power-on initialization tables for selected enCoRe III block configurations and creates source code for an application framework. The framework contains software to operate the selected components and, if the project uses more than one operating configuration, contains routines to switch between different sets of enCoRe III block configurations at run time. PSoC Designer can print out a configuration sheet for a given project configuration for use during application programming in conjunction with the Device Data Sheet. Once the framework is generated, the user can add application-specific code to flesh out the framework. It is also possible to change the selected components and regenerate the framework.

Application Editor

In the Application Editor you can edit your C language and Assembly language source code. You can also assemble, compile, link, and build.

Assembler. The macro assembler allows the assembly code to merge seamlessly with C code. The link libraries automatically use absolute addressing or is compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compiler. A C language compiler is available that supports the enCoRe III family of devices. Even if you have never worked in the C language before, the product quickly allows you to create complete C programs for the enCoRe III devices.

The embedded, optimizing C compiler provides all the features of C tailored to the enCoRe III architecture. It comes complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

The PSoC Designer Debugger subsystem provides hardware in-circuit emulation, allowing the designer to test the program in a physical system while providing an internal view of the enCoRe III device. Debugger commands allow the designer to read and program and read and write data memory, read and write IO registers, read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help for the user. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

Hardware Tools

In-Circuit Emulator

A low cost, high functionality ICE Cube is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal which operates with all enCoRe III devices.

Designing with User Modules

The development process for the enCoRe III device differs from that of a traditional fixed-function microprocessor. The configurable analog and digital hardware blocks give the enCoRe III architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called enCoRe III Blocks, have the ability to implement a wide variety of user-selectable functions. Each block has several registers that determine its function and connectivity to other blocks, multiplexers, buses and to the IO pins. Iterative development cycles permit you to adapt the hardware and software. This substantially lowers the risk of having to select a different part to meet the final design requirements.

To speed the development process, the PSoC Designer Integrated Development Environment (IDE) provides a library of pre-built, pre-tested hardware peripheral functions, called "User Modules." User modules make selecting and implementing peripheral devices simple, and come in analog, digital, and mixed signal varieties.

The user module library contains the following digital and analog module designs:

- Analog Blocks
 - Incremental ADC (ADCINC)
 - Delta Sigma ADC (DelSig)
 - Programmable Threshold Comparator (CMPPRG)
- Digital Blocks
 - Counters: 8-bit and 16-bit (Counter8 and Counter 16)
 - PWMs: 8-bit and 16-bit (PWM8 and PWM16)
 - Timers: 8-bit and 16-bit (Timer8 and Timer 16)
 - I²C Master (I²Cm)
 - SPI Master (SPIM)
 - SPI Slave (SPIS)
 - Full Duplex UART (UART)
 - RF (CYFISNP and CYFISPI)
- System Resources
 - Protocols:
 - USBFS
 - I2C Bootheader (Boothdr I²C)
 - USB Bootheader (BoothdrUSBFS)
 - USBUART
 - Digital System Resources
 - E2PROM
 - LCD
 - LED
 - 7-segment LED (LED7SEG)
 - Shadow Registers (SHADOWREG)
 - Sleep Timer

Each user module establishes the basic register settings that implement the selected function. It also provides parameters that allow you to tailor its precise configuration to your particular application. For example, a Pulse Width Modulator User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit the designer to establish the pulse width and duty cycle. User modules also provide tested software to cut development time. The user module application programming interface (API) provides high-level functions to control and respond to hardware events at run-time. The API also provides optional interrupt service routines that is adapted as needed.

The API functions are documented in user module data sheets that are viewed directly in the PSoC Designer IDE. These data sheets explain the internal operation of the user module and provide performance specifications. Each data sheet describes the use of each user module parameter and documents the setting of each register controlled by the user module.

The development process starts when you open a new project and bring up the Device Editor/Chip Layout View, a graphical user interface (GUI) for configuring the hardware. You pick the user modules you need for your project and map them onto the PSoC blocks with point-and-click simplicity. Next, you build signal chains by interconnecting user modules to each other and the IO pins. At this stage, you also configure the clock source connections and enter parameter values directly or by selecting values from drop-down menus. When you are ready to test the hardware configuration or move on to developing code for the project, you perform the “Generate Application” step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the high-level user module API functions.

Figure 4. User Module and Source Code Development Flows

The next step is to write your main program, and any sub-routines using PSoC Designer’s Application Editor subsystem. The Application Editor includes a Project Manager that allows you to open the project source code files (including all generated code files) from a hierarchal view. The source code editor provides syntax coloring and advanced edit features for both C and assembly language. File search capabilities include simple string searches and recursive “grep-style” patterns. A single mouse click invokes the Build Manager. It employs a professional-strength “makefile” system to automatically analyze all file dependencies and run the compiler and assembler as necessary. Project level options control optimization strategies used by the compiler and linker. Syntax errors are displayed in a console window. Double clicking the error message takes you directly to the offending line of source code. When all is correct, the linker builds a HEX file image suitable for programming.

The last step in the development process takes place inside the PSoC Designer’s Debugger subsystem. The Debugger downloads the HEX image to the In-Circuit Emulator (ICE CUBE) where it runs at full speed. Debugger capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the Debugger provides a large trace buffer and allows you define complex breakpoint events that include monitoring address and data bus values, memory locations and external signals.

IPOR	imprecise power on reset

Units of Measure

A units of measure table is located in the Electrical Specifications section. [Table 5](#) on page 13 lists all the abbreviations used to measure the enCoRe III devices.

Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (For example, '01010100b' or '01000011b'). Numbers not indicated by an 'h' or 'b' are decimal.

56-Pin Part Pinout

The CY7C64215 enCoRe III device is available in a 56-pin package which is listed and illustrated in the following table. Every port pin (labeled “P”) is capable of Digital IO. However, Vss and Vdd are not capable of Digital IO.

Electrical Specifications

This section presents the DC and AC electrical specifications of the CY7C64215 enCoRe III. For the most up to date electrical specifications, confirm that you have the most recent data sheet by going to the web at <http://www.cypress.com>.

Specifications are valid for $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$ and $T_J \leq 100^{\circ}\text{C}$, except where noted. Specifications for devices running at greater than 12 MHz are valid for $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$ and $T_J \leq 82^{\circ}\text{C}$.

Figure 5. Voltage versus CPU Frequency

The following table lists the units of measure that are used in this section.

Table 5. Units of Measure

Symbol	Unit of Measure	Symbol	Unit of Measure
$^{\circ}\text{C}$	degree Celsius	μW	microwatts
dB	decibels	mA	milliampere
fF	femto farad	ms	millisecond
Hz	hertz	mV	millivolts
KB	1024 bytes	nA	nanoampere
Kbit	1024 bits	ns	nanosecond
kHz	kilohertz	nV	nanovolts
k Ω	kilohm	W	ohm
MHz	megahertz	pA	picoampere
M Ω	megaohm	pF	picofarad
μA	microampere	pp	peak-to-peak
μF	microfarad	ppm	parts per million
μH	microhenry	ps	picosecond
μs	microsecond	sps	samples per second

Note

1. This is a valid operating region for the CPU, but USB hardware is non-functional in the voltage range from 3.60V – 4.35V.

Table 5. Units of Measure (continued)

Symbol	Unit of Measure	Symbol	Unit of Measure
μV	microvolts	s	sigma: one standard deviation
μVrms	microvolts root-mean-square	V	volts

Absolute Maximum Ratings

Table 6. Absolute Maximum Ratings

Parameter	Description	Min	Typ	Max	Unit	Notes
T_{STG}	Storage Temperature	-55	-	+100	°C	Higher storage temperatures reduces data retention time.
T_{A}	Ambient Temperature with Power Applied	0	-	+70	°C	
Vdd	Supply Voltage on Vdd Relative to Vss	-0.5	-	+6.0	V	
V_{IO}	DC Input Voltage	$V_{\text{SS}} - 0.5$	-	$V_{\text{DD}} + 0.5$	V	
V_{IO2}	DC Voltage Applied to Tri-state	$V_{\text{SS}} - 0.5$	-	$V_{\text{DD}} + 0.5$	V	
I_{MIO}	Maximum Current into any Port Pin	-25	-	+50	mA	
I_{MAIO}	Maximum Current into any Port Pin Configured as Analog Driver	-50	-	+50	mA	
ESD	Electro Static Discharge Voltage	2000	-	-	V	Human Body Model ESD.
LU	Latch Up Current	-	-	200	mA	

Operating Temperature

Table 7. Operating Temperature

Parameter	Description	Min	Typ	Max	Unit	Notes
T_{A}	Ambient Temperature	0	-	+70	°C	
T_{J}	Junction Temperature	0	-	+88	°C	The temperature rise from ambient to junction is package specific. See “Thermal Impedance” on page 28. The user must limit the power consumption to comply with this requirement.

DC Electrical Characteristics

DC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, or 3.0V to 3.6V and $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Table 8. DC Chip-Level Specifications

Parameter	Description	Min	Typ	Max	Unit	Notes
V _{DD}	Supply Voltage	3.0	–	5.25	V	See DC POR and LVD specifications, Table 16 on page 19. USB hardware is not functional when V _{DD} is between 3.6V - 4.35V.
I _{DD5}	Supply Current, IMO = 24 MHz (5V)	–	14	27	mA	Conditions are V _{DD} = 5.0V, T _A = 25°C, CPU = 3 MHz, SYSClk doubler disabled, VC1 = 1.5 MHz, VC2 = 93.75 kHz, VC3 = 93.75 kHz, analog power = off.
I _{DD3}	Supply Current, IMO = 24 MHz (3.3V)	–	8	14	mA	Conditions are V _{DD} = 3.3V, T _A = 25°C, CPU = 3 MHz, SYSClk doubler disabled, VC1 = 1.5 MHz, VC2 = 93.75 kHz, VC3 = 0.367 kHz, analog power = off.
I _{SB}	Sleep (Mode) Current with POR, LVD, Sleep Timer, and WDT. ^[2]	–	3	6.5	μA	Conditions are with internal slow speed oscillator, V _{DD} = 3.3V, $0^{\circ}\text{C} \leq T_A \leq 55^{\circ}\text{C}$, analog power = off.
I _{SBH}	Sleep (Mode) Current with POR, LVD, Sleep Timer, and WDT at high temperature. ^[2]	–	4	25	μA	Conditions are with internal slow speed oscillator, V _{DD} = 3.3V, $55^{\circ}\text{C} < T_A \leq 70^{\circ}\text{C}$, analog power = off.

DC General Purpose IO Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, or 3.0V to 3.6V and $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Table 9. DC GPIO Specifications

Parameter	Description	Min	Typ	Max	Unit	Notes
R _{PU}	Pull-Up Resistor	4	5.6	8	kΩ	
R _{PD}	Pull-Down Resistor	4	5.6	8	kΩ	
V _{OH}	High Output Level	V _{DD} – 1.0	–	–	V	I _{OH} = 10 mA, V _{DD} = 4.75 to 5.25V (8 total loads, 4 on even port pins (for example, P0[2], P1[4]), 4 on odd port pins (for example, P0[3], P1[5])). 80 mA maximum combined IOH budget.
V _{OL}	Low Output Level	–	–	0.75	V	I _{OL} = 25 mA, V _{DD} = 4.75 to 5.25V (8 total loads, 4 on even port pins (for example, P0[2], P1[4]), 4 on odd port pins (for example, P0[3], P1[5])). 150 mA maximum combined IOL budget.
V _{IL}	Input Low Level	–	–	0.8	V	V _{DD} = 3.0 to 5.25.
V _{IH}	Input High Level	2.1	–	–	V	V _{DD} = 3.0 to 5.25.
V _H	Input Hysteresis	–	60	–	mV	
I _{IL}	Input Leakage (Absolute Value)	–	1	–	nA	Gross tested to 1 μA.
C _{IN}	Capacitive Load on Pins as Input	–	3.5	10	pF	Package and pin dependent. Temp = 25°C.
C _{OUT}	Capacitive Load on Pins as Output	–	3.5	10	pF	Package and pin dependent. Temp = 25°C.

Note

- Standby current includes all functions (POR, LVD, WDT, Sleep Time) needed for reliable system operation. This should be compared with devices that have similar functions enabled.

DC Full-Speed USB Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, or 3.0V to 3.6V and $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Flash _{DR}	Flash Data Retention	10	–	–	Years	

Note

6. A maximum of 36 x 50,000 block endurance cycles is allowed. This may be balanced between operations on 36x1 blocks of 50,000 maximum cycles each, 36x2 blocks of 25,000 maximum cycles each, or 36x4 blocks of 12,500 maximum cycles each (to limit the total number of cycles to 36x50,000 and that no single block ever sees more than 50,000 cycles).
 For the full industrial range, the user must employ a temperature sensor user module (FlashTemp) and feed the result to the temperature argument before writing. Refer to the Flash APIs Application Note AN2015 at <http://www.cypress.com> under Application Notes for more information.

Note

12. A Fast-Mode I²C-bus device can be used in a Standard-Mode I²C-bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must then be met. This automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{max} + t_{SU;DAT} = 1000 + 250 = 1250$ ns (according to the Standard-Mode I²C-bus specification) before the SCL line is released.

Packaging Information

This section illustrates the package specification for the CY7C64215 enCoRe III, along with the thermal impedance for the package.

Important Note Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at <http://www.cypress.com/design/MR10161>.

*Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are 220±5°C with Sn-Pb or 245±5°C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

Package Handling

Some IC packages require baking before they are soldered onto a PCB to remove moisture that may have been absorbed after leaving the factory. A label on the packaging has details about actual bake temperature and the minimum bake time to remove this moisture. The maximum bake time is the aggregate time that the parts are exposed to the bake temperature. Exceeding this exposure time may degrade device reliability.
